Profile

Before You Begin This Course

Before you begin this course, you should have thorough knowledge of SQL and knowledge of any procedural programming language. Required prerequisite is *Oracle Database 10g: SQL Fundamentals*.

How This Course Is Organized

Oracle Database 10g: PL/SQL Fundamentals is an instructor-led course featuring lectures and hands-on exercises. Online demonstrations and practice sessions reinforce the concepts and skills that are introduced.

Related Publications

Additional Publications

- System release bulletins
- Installation and user's guides
- `read.me` files
- International Oracle User's Group (IOUG) articles
- *Oracle Magazine*

Typographic Conventions

Following are two lists of typographical conventions that are used specifically within text or within code.

Typographic Conventions Within Text

Convention	Object or Term	Example
Uppercase	Commands, functions, column names, PL/SQL objects, schemas	Use the SELECT command to view information stored in the LAST_NAME column of the employees table.
Lowercase,	Filenames, variables, table names, usernames, passwords	where: <i>role</i> is the name of the role italic
Initial cap	Trigger and button names	Assign a When-Validate-Item trigger to the ORD block. Choose Cancel.
Italic	Books, names of courses and manuals, and emphasized words or phrases	For more information on the subject, see <i>Oracle9i Server SQL Language Reference Manual</i> .
Quotation marks	Lesson module titles referenced within a course	Do <i>not</i> save changes to the database. This subject is covered in Lesson 3, “Working with Objects.”

Typographic Conventions (continued)

Typographic Conventions Within Code

Convention	Object or Term	Example
Uppercase	Commands, functions	SELECT userid FROM emp;
Lowercase,	Syntax variables	CREATE ROLE <i>role</i> ;
Initial cap	Forms triggers	Form module: ORD Trigger level: S_ITEM.QUANTITY item Trigger name: When-Validate-Item . . .
Lowercase	Column names, table names, filenames, PL/SQL objects	. . . OG_ACTIVATE_LAYER (OG_GET_LAYER ('prod_pie_layer')) . . . SELECT last_name FROM emp;
Bold	Text that must be entered by a user	DROP USER scott;

Course Agenda I-4
The Human Resources (hr) Data Set I-5
Oracle 10g I-8
Oracle 10g Database I-9
Oracle Application Server 10g I-10
Oracle Enterprise Manager 10g Grid Control I-11
Oracle Internet Platform I-12
Summary I-13
Practices in The Course I-14

1 Introduction to PL/SQL

Objectives 1-2
What is PL/SQL? 1-3
About PL/SQL 1-4
PL/SQL Environment 1-5
Benefits of PL/SQL 1-6
PL/SQL Block Structure 1-9
Block Types 1-10
Programs Constructs 1-13
PL/SQL Programming Environments 1-15
*i*SQL*Plus Architecture 1-18
Create an Anonymous Block 1-19
Execute an Anonymous Block 1-20
Test the Output of a PL/SQL Block 1-21
Summary 1-23

2 Declaring PL/SQL Variables

Objectives 2-2
Use of Variables 2-3
Identifiers 2-4
Handling Variables in PL/SQL 2-5
Declaring and Initializing PL/SQL Variables 2-6
Delimiters in String Literals 2-8
Types of Variables 2-9
Guidelines for Declaring and Initializing PL/SQL Variables 2-11
Guidelines for Declaring PL/SQL Variables 2-12
Scalar Data Types 2-13
Base Scalar Data Types 2-14
BINARY_FLOAT and BINARY_DOUBLE 2-18

Declaring Scalar Variables 2-20
The %TYPE Attribute 2-21
Declaring Variables with the %TYPE Attribute 2-23
Declaring Boolean Variables 2-24
Bind Variables 2-25
Printing Bind Variables 2-27
Substitution Variables 2-29
Prompt for Substitution Variables 2-31
Using DEFINE for User Variable 2-32
Composite Data Types 2-33
LOB Data Type Variables 2-34
Summary 2-35
Practice 2: Overview 2-36

3 Writing Executable Statements

Objectives 3-2
Lexical Units in a PL/SQL Block 3-3
PL/SQL Block Syntax and Guidelines 3-5
Commenting Code 3-6
SQL Functions in PL/SQL 3-7
SQL Functions in PL/SQL: Examples 3-8
Data Type Conversion 3-9
Data Type Conversions 3-10
Data Type Conversion 3-11
Nested Blocks 3-12
Variable Scope and Visibility 3-14
Qualify an Identifier 3-16
Determining Variable Scope 3-17
Operators in PL/SQL 3-18
Programming Guidelines 3-20
Indenting Code 3-21
Summary 3-22
Practice 3: Overview 3-23

4 Interacting with the Oracle Server

Objectives 4-2
SQL Statements in PL/SQL 4-3
SELECT Statements in PL/SQL 4-5
Retrieving Data in PL/SQL 4-9
Naming Conventions 4-11
Manipulating Data Using PL/SQL 4-13
Inserting Data 4-14
Updating Data 4-15
Deleting Data 4-16
Merging Rows 4-17
SQL Cursor 4-19

SQL Cursor Attributes for Implicit Cursors 4-21
Summary 4-23
Practice 4: Overview 4-24

5 Writing Control Structures

Objectives 5-2
Controlling Flow of Execution 5-3
IF Statements 5-4
Simple IF Statement 5-6
IF THEN ELSE Statement 5-7
IF ELSIF ELSE Clause 5-8
NULL Values in IF Statements 5-9
CASE Expressions 5-10
CASE Expressions: Example 5-11
Searched CASE Expressions 5-12
CASE Statement 5-13
Handling Nulls 5-14
Logic Tables 5-15
Boolean Conditions 5-16
Iterative Control: LOOP Statements 5-17
Basic Loops 5-18
WHILE Loops 5-20
FOR Loops 5-22
Guidelines While Using Loops 5-26
Nested Loops and Labels 5-27
Summary 5-29
Practice 5: Overview 5-30

6 Working with Composite Data Types

Objectives 6-2
Composite Data Types 6-3
PL/SQL Records 6-5
Creating a PL/SQL Record 6-6
PL/SQL Record Structure 6-8
The %ROWTYPE Attribute 6-9
Advantages of Using %ROWTYPE 6-11
The %ROWTYPE Attribute 6-12
Inserting a Record Using %ROWTYPE 6-13
Updating a Row in a Table Using a Record 6-14
INDEX BY Tables or Associative Arrays 6-15
Creating an INDEX BY Table 6-16
INDEX BY Table Structure 6-18
Creating an INDEX BY Table 6-19
Using INDEX BY Table Methods 6-20
INDEX BY Table of Records 6-21

Example of INDEX BY Table of Records 6-23
Nested Tables 6-24
VARRAY 6-26
Summary 6-27
Practice 6: Overview 6-28

7 Using Explicit Cursors

Objectives 7-2
About Cursors 7-3
Explicit Cursor Operations 7-4
Controlling Explicit Cursors 7-5
Declaring the Cursor 7-7
Opening the Cursor 7-9
Fetching Data from the Cursor 7-10
Closing the Cursor 7-13
Cursors and Records 7-14
Cursor FOR Loops 7-15
Explicit Cursor Attributes 7-17
The %ISOPEN Attribute 7-18
Example of %ROWCOUNT and %NOTFOUND 7-19
Cursor FOR Loops Using Subqueries 7-20
Cursors with Parameters 7-21
The FOR UPDATE Clause 7-23
The WHERE CURRENT OF Clause 7-25
Cursors with Subqueries 7-26
Summary 7-27
Practice 7: Overview 7-28

8 Handling Exceptions

Objectives 8-2
Example 8-3
Handling Exceptions with PL/SQL 8-5
Handling Exceptions 8-6
Exception Types 8-7
Trapping Exceptions 8-8
Guidelines for Trapping Exceptions 8-10
Trapping Predefined Oracle Server Errors 8-11
Trapping Non-Predefined Oracle Server Errors 8-14
Non-Predefined Error 8-15
Functions for Trapping Exceptions 8-16
Trapping User-Defined Exceptions 8-18
Calling Environments 8-20
Propagating Exceptions in a Subblock 8-21
The RAISE_APPLICATION_ERROR Procedure 8-22
RAISE_APPLICATION_ERROR 8-24
Summary 8-25
Practice 8: Overview 8-26

9 Creating Stored Procedures and Functions

Objectives 9-2

Procedures and Functions 9-3

Differences Between Anonymous Blocks and Subprograms 9-4

Procedure: Syntax 9-5

Procedure: Example 9-6

Invoking the Procedure 9-8

Function: Syntax 9-9

Function: Example 9-10

Invoking the Function 9-11

Passing Parameter to the Function 9-12

Invoking the Function with a Parameter 9-13

Summary 9-14

Practice 9: Overview 9-15

Objectives

After completing this lesson, you should be able to do the following:

- **Describe the objectives of the course**
- **Describe the course agenda**
- **Identify the database tables used in the course**
- **Identify the Oracle products that help you design a complete business solution**

Lesson Aim

This lesson gives you a high-level overview of the course. You see the flow of the course. You get familiarized with the database schema and the tables that the course uses. Also, you are introduced to different products in the Oracle 10g grid infrastructure.

Course Objectives

After completing this course, you should be able to do the following:

- **Appreciate that PL/SQL provides programming extensions to SQL**
- **Write PL/SQL code to interface with the database**
- **Design PL/SQL program units that execute efficiently**
- **Use PL/SQL programming constructs and conditional control statements**
- **Handle run-time errors**
- **Describe stored procedures and functions**

Course Objectives

This course is designed to impart basic knowledge of PL/SQL. You learn that PL/SQL provides programming extensions to SQL. You learn about PL/SQL syntax, blocks, and programming constructs and will be able to appreciate the advantages of integrating SQL with the programming constructs. This course teaches you how to write PL/SQL program units and execute them efficiently. In addition, you learn how to use iSQL*Plus as development environment for PL/SQL. You also learn how to design reusable program units such as procedures and functions.

Course Agenda

Lessons that are to be covered on day 1:

- I. Introduction**
- 1. Introduction to PL/SQL**
- 2. Declaring PL/SQL Variables**
- 3. Creating the Executable Section**
- 4. Interacting with the Oracle Database Server**
- 5. Writing Control Structures**

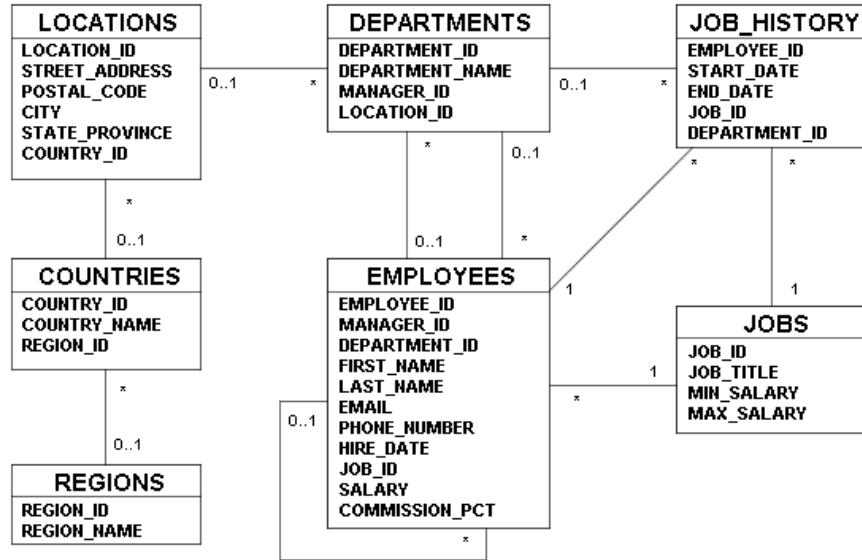

Course Agenda

Lessons that are to be covered on day 2:

- 6. Working with Composite Data Types**
- 7. Using Explicit Cursors**
- 8. Including Exception Handling**
- 9. Creating Stored Procedures and Functions**

The Human Resources (hr) Data Set

ORACLE®

I-6

Copyright © 2004, Oracle. All rights reserved.

The Human Resources (hr) Data Set

The Human Resources (hr) schema is a part of the Oracle Sample Schema that can be installed into an Oracle database. As the name indicates, the hr schema has tables that store all the necessary and related information of all employees working in the organization. To reduce the complexity and the volume of data, the various information of employees is stored in more than one table. For example, if an employee works in the education department, it is not necessary to store the information about the employee as well as the education department in one table. Instead, you can store employee information in the employees table and department information in the departments table. The hr schema is built on similar lines.

The slide shows the tables and relationships between tables in the hr schema. The table names in the hr schema are self explanatory.

Table Descriptions

employees contains details about each employee working for a department. Some employees may not be assigned to any department.

departments shows details of the departments in which employees work. Each department may have a relationship representing the department manager in the employees table.

The Human Resources (hr) Data Set (continued)

Table Descriptions (continued)

`jobs` contains the job types that can be held by each employee.

`job_history` contains the job history of the employees. If an employee changes departments within the job or changes jobs within the department, a new row gets inserted into this table with the old job information of the employee.

`locations` contains the specific address of a specific office, warehouse, and/or production site of a company in a particular country.

`regions` contains rows representing a region, such as Americas, Asia, and so on.

`countries` contains rows for countries, each of which are associated with a region.

Note: This lesson introduces you to the various tables in the `hr` schema. If you want to look at the data stored in each of these tables, then refer to Appendix-B (“Table Descriptions and Data”) of the course.

Oracle10g

I-8

Copyright © 2004, Oracle. All rights reserved.

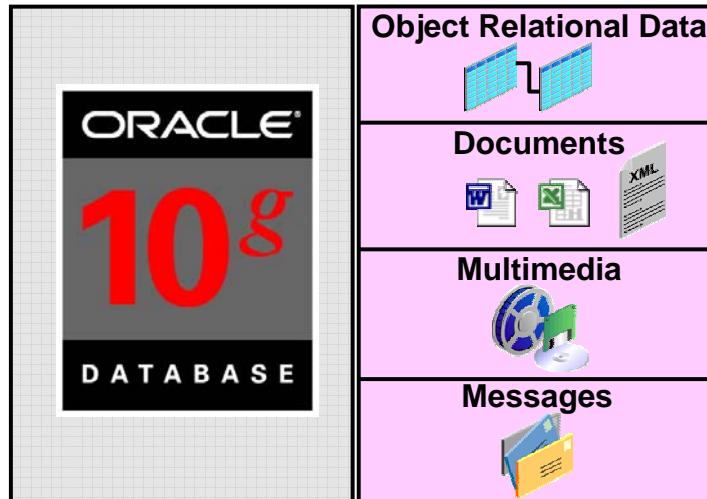

ORACLE®

Oracle10g

The three grid infrastructure products of the Oracle10g release are:

- Oracle Database 10g
- Oracle Application Server 10g
- Oracle Enterprise Manager 10g Grid Control

Oracle Database 10g

Oracle Database 10g

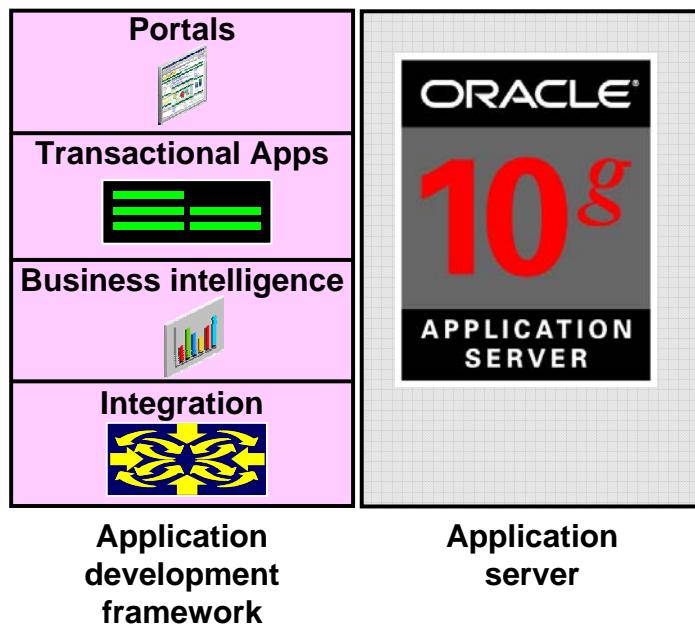

Oracle Database 10g is designed to store and manage enterprise information. By using Oracle Database 10g, the management can reduce costs and be assured of a high quality of service. Reduced configuration and management requirements and automatic SQL tuning have significantly reduced the cost of maintaining the environment. Oracle Database 10g contributes to the grid infrastructure products of the Oracle 10g release. Grid computing is all about computing as a utility. If you are a client, you need not know where your data resides or which computer stores it. You should be able to request information or do computations on your data and have it delivered to you.

Oracle Database 10g manages all your data. This is not just the object relational data that you expect an enterprise database to manage. It can also be unstructured data like:

- Spreadsheets
- Word documents
- PowerPoint presentations
- XML
- Multimedia data types like MP3, graphics, video, and more

The data does not even have to be in the database. Oracle Database 10g has services through which you can store metadata about information stored in file systems. You can use the database server to manage and serve information wherever it is located.

Oracle Application Server 10g

Oracle Application Server 10g

Oracle Application Server 10g provides a complete infrastructure platform for developing and deploying enterprise applications, integrating many functions including a J2EE and Web services run-time environment, an enterprise portal, an enterprise integration broker, business intelligence, Web caching, and identity management services. Oracle Application Server 10g adds new grid computing features, building on the success of Oracle9*i* Application Server, which has hundreds of customers running production enterprise applications.

Oracle Application Server 10g is the only application server to include services for all the different server applications that you want to run. It can run your:

- Portals or Web sites
- Java transactional applications
- Business intelligence applications

It also provides integration between users, applications, and data throughout your organization.

Oracle Enterprise Manager 10g Grid Control

- **Software provisioning**
- **Application service-level monitoring**

I-11

Copyright © 2004, Oracle. All rights reserved.

ORACLE®

Oracle Enterprise Manager 10g Grid Control

Oracle Enterprise Manager 10g Grid Control is a complete, integrated, central management console and underlying framework that automates administrative tasks across sets of systems in a grid environment. With Oracle Grid Control, you can group multiple hardware nodes, databases, application servers, and other targets into single logical entities. By executing jobs, enforcing standard policies, diagnosing and monitoring performance and automating many other tasks across a group of targets instead of on many systems individually, Grid Control enables scaling with a growing grid.

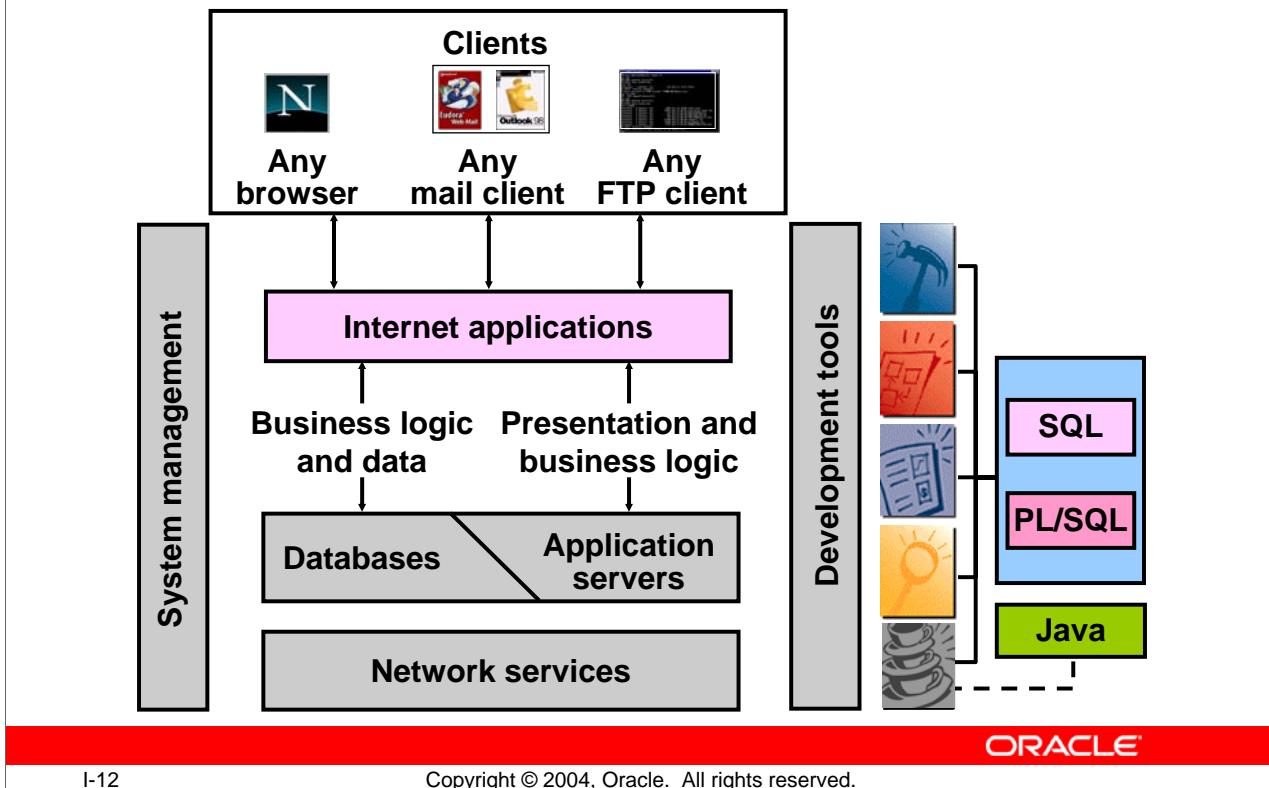

Software Provisioning

With Grid Control, Oracle 10g automates installation, configuration, and cloning of Application Server 10g and Database 10g across multiples nodes. Oracle Enterprise Manager provides a common framework for software provisioning and management, allowing administrators to create, configure, deploy, and utilize new servers with new instances of the application server and database as they are needed.

Application Service-Level Monitoring

Oracle Grid Control views the availability and performance of the grid infrastructure as a unified whole, as a user would experience it, rather than as isolated storage units, processing boxes, databases, and application servers.

Oracle Internet Platform

Oracle Internet Platform

To develop an e-commerce application you would need a product that can store and manage the data, a product that can provide a run-time environment for your applications implementing business logic, and a product that can monitor and diagnose the application after it is integrated. Oracle 10g products, discussed earlier, provide all the necessary components to develop your enterprise. Oracle offers a comprehensive high-performance Internet platform for e-commerce and data warehousing. This integrated platform includes everything needed to develop, deploy, and manage Internet applications. The Oracle Internet Platform is built on three core pieces:

- Browser-based clients to process presentation
- Application servers to execute business logic and serve presentation logic to browser-based clients
- Databases to execute database-intensive business logic and server data

Oracle offers a wide variety of the most advanced graphical user interface (GUI) driven development tools to build business applications, as well as a large suite of software applications for many areas of business and industry. Stored procedures, functions, and packages can be written by using SQL, PL/SQL, or Java.

Summary

In this lesson, you should have learned how to:

- **Describe the course objectives and course agenda**
- **Identify the tables and their relationships in the hr schema**
- **Identify the various products in the Oracle 10g grid infrastructure that enable you to develop a complete business solution**

Summary

This lesson introduced you to the course. You learned about the lessons that will be covered on each day of the course. You got introduced to the hr schema that is used in this course. You should be able to identify the relationships between the tables in the hr schema. You also learned about the various products that enable you to develop your business application.

Practices in the Course

As you perform practices in the course, you will develop a simple application using an anonymous block. This anonymous block covers the following:

- Writing a declarative section
- Declaring variables of scalar types
- Declaring variables using the %TYPE attribute
- Writing an executable section
- Accepting user inputs for variables
- Retrieving the values from the database and storing the values in the variables by using the INTO clause
- Writing a nested block within the executable section
- Using the control structures in the executable section to perform business logic
- Using the INDEX BY table to store values and print them
- Handling exceptions

What Is the Functionality of This Application?

This application is a simple HR application and only employees working in the Human Resources department are authorized to use it. In the employees table, only one employee is in the HR department. Therefore, you can use employee_id for authentication.

The company has decided to provide salary raises to employees in some of the departments this quarter. The company has decided the raise percentage depending on the current salaries. Employees in the following departments are eligible for raises this quarter:

department_id	department_name
20	Marketing
60	IT
80	Sales
100	Finance
110	Accounting

The salary range and the raise percentage are as follows:

salary	Raise percentage
< 6500	20
> 6500 < 9500	15
> 9500 < 12000	8
> 12000	3

1

Introduction to PL/SQL

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Lesson Objectives

After completing this lesson, you should be able to do the following:

- Explain the need for PL/SQL
- Explain the benefits of PL/SQL
- Identify the different types of PL/SQL blocks
- Use *iSQL*Plus* as a development environment for PL/SQL
- Output messages in PL/SQL

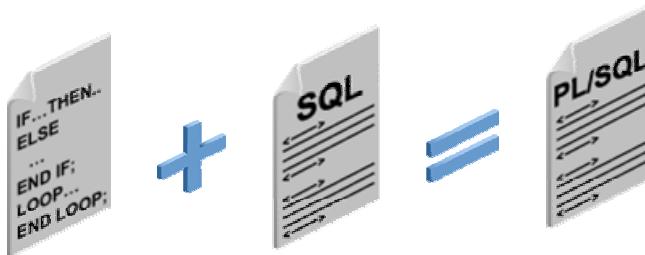

Lesson Aim

This lesson introduces PL/SQL and PL/SQL programming constructs. You learn about the benefits of PL/SQL. You also learn to use *iSQL*Plus* as development environment for PL/SQL.

What Is PL/SQL?

PL/SQL:

- **Stands for Procedural Language extension to SQL**
- **Is Oracle Corporation's standard data access language for relational databases**
- **Seamlessly integrates procedural constructs with SQL**

ORACLE®

1-3

Copyright © 2004, Oracle. All rights reserved.

What Is PL/SQL?

Structured Query Language (SQL) is the primary language used to access and modify data in a relational databases. There are a few SQL commands, which you can easily learn and use efficiently. Consider an example:

```
SELECT first_name, department_id, salary FROM employees;
```

The SQL statement shown above is simple and straightforward. However, if you want to alter any data that is retrieved in a conditional manner, you come across the limitations of SQL.

Consider a slightly modified problem statement:

For every employee retrieved, check the department_id and the salary. Depending on the department's performance and also the employees salary, you may want to provide varying bonuses to the employees.

Looking at the problem, you know that you have to execute the above SQL statement, collect the data, and apply logic to the data. One way of dealing with it is to write SQL statements for each department and giving bonuses to the employees in that department. Remember that you also have to check the salary component before deciding the bonus amount. This makes it a little complicated. You now feel that it would be much easier if you had conditional statements. PL/SQL is designed to meet such requirements. It provides a programming extension to already existing SQL.

About PL/SQL

PL/SQL:

- **Provides a block structure for executable units of code. Maintenance of code is made easier with such a well-defined structure.**
- **Provides procedural constructs such as:**
 - **Variables, constants, and types**
 - **Control structures such as conditional statements and loops**
 - **Reusable program units that are written once and executed many times**

ORACLE®

1-4

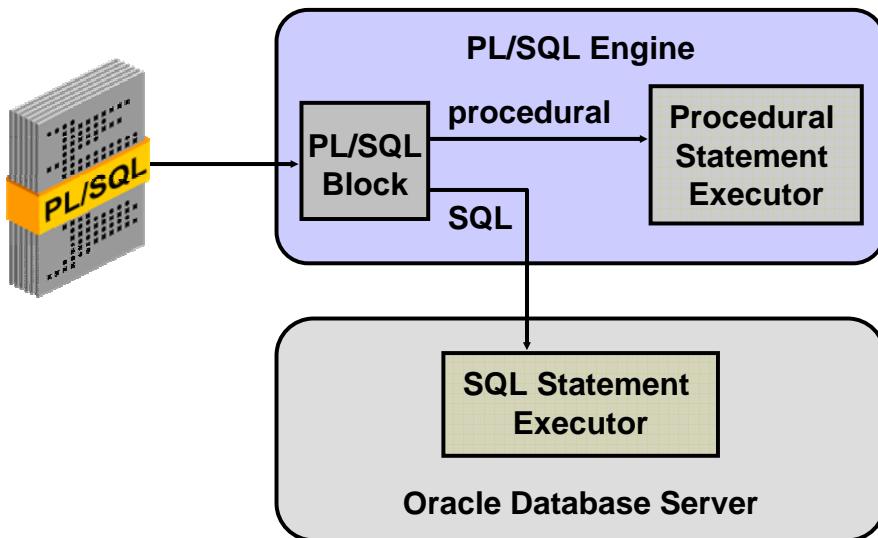

Copyright © 2004, Oracle. All rights reserved.

About PL/SQL

PL/SQL defines a block structure for writing code. Maintaining and debugging the code is made easier with such a structure. One can easily understand the flow and execution of the program unit.

PL/SQL offers modern software engineering features such as data encapsulation, exception handling, information hiding, object orientation, and brings state-of-the-art programming to the Oracle server and toolset. PL/SQL provides all the procedural constructs that are available in any third generation language (3GL).

PL/SQL Environment

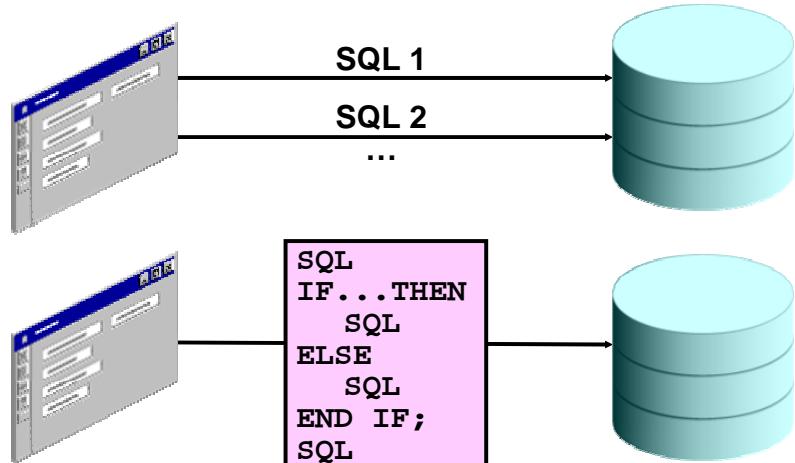

PL/SQL Environment

The slide shows the PL/SQL execution environment in the Oracle database server. A PL/SQL block contains procedural statements and SQL statements. When you submit the PL/SQL block to the server, the PL/SQL engine first parses the block. The PL/SQL engine identifies the procedural statements and SQL statements. It passes the procedural statements to the procedural statement executor and passes the SQL statements to the SQL statement executor individually.

The diagram in the slide shows the PL/SQL engine within the database server. Oracle's Application Development Tools can also contain a PL/SQL engine. The tool passes the blocks to its local PL/SQL engine. Therefore, all procedural statements are executed locally and only the SQL statements are executed in the database. The engine used depends on where the PL/SQL block is being invoked from.

Benefits of PL/SQL

- **Integration of procedural constructs with SQL**
- **Improved performance**

ORACLE®

1-6

Copyright © 2004, Oracle. All rights reserved.

Benefits of PL/SQL

Integration of procedural constructs with SQL: The first and foremost advantage of PL/SQL is the integration of procedural constructs with SQL. SQL is a nonprocedural language. When you issue a SQL command, your command tells the database server *what* to do. However, you cannot specify *how* to do it. PL/SQL integrates control statements and conditional statements with SQL. This gives you a better control of your SQL statements and their execution. You have already seen an example earlier in this lesson, that shows the need for such an integration.

Improved performance: Without PL/SQL you would not be able to logically combine SQL statements as one unit. If you have designed an application containing forms, you may have many different forms with fields in each form. When a form submits the data, you may have to execute a number of SQL statements. SQL statements are sent to the database one at a time. This results in many network trips and one call to the database for each SQL statement. This increases the network traffic and reduces performance especially in a client/server model.

With PL/SQL you can combine all these SQL statements into a single program unit. The application can send the entire block to the database instead of sending the SQL statements one at a time. This significantly reduces the number of database calls. As the slide illustrates, if the application is SQL intensive, you can use PL/SQL blocks to group SQL statements before sending them to the Oracle database server for execution.

Benefits of PL/SQL

- **Modularized program development**
- **Integration with Oracle tools**
- **Portability**
- **Exception handling**

ORACLE®

1-7

Copyright © 2004, Oracle. All rights reserved.

Benefits of PL/SQL (continued)

Modularized program development: A basic unit in a PL/SQL program is a block. All PL/SQL programs contain blocks. These blocks can be in a sequence or they can be nested in other blocks. Modularized program development has the following advantages:

- You can group logically related statements within blocks.
- You can nest blocks inside larger blocks to build powerful programs.
- You can break your application into smaller modules. If you are designing a complex application, PL/SQL allows you to break down the application into smaller, manageable, and logically related modules.
- You can easily maintain and debug the code.

Integration with tools: The PL/SQL engine is integrated in Oracle tools such as Oracle Forms, Oracle Reports, and so on. When you use these tools, the locally available PL/SQL engine processes the procedural statements and only the SQL statements are passed to the database.

Benefits of PL/SQL (continued)

Portability: PL/SQL programs can run anywhere Oracle server runs irrespective of the operating system and the platform. You do not need to tailor them to each new environment. You can write portable program packages and create libraries that can be reused in different environments.

Exception handling: PL/SQL allows you to handle exceptions efficiently. You can define separate blocks for dealing with exceptions. You will learn more about exception handling later in the course.

PL/SQL shares the same datatype system as SQL (with some extensions) and uses the same expression syntax.

PL/SQL Block Structure

DECLARE (Optional)

Variables, cursors, user-defined exceptions

BEGIN (Mandatory)

- SQL statements
- PL/SQL statements

EXCEPTION (Optional)

**Actions to perform
when errors occur**

END; (Mandatory)

ORACLE®

1-9

Copyright © 2004, Oracle. All rights reserved.

PL/SQL Block Structure

The slide shows a basic PL/SQL block. A PL/SQL block consists of three sections:

- Declarative (optional): The declarative section begins with the keyword DECLARE and ends when your executable section starts.
- Executable (required): The executable section begins with the keyword BEGIN and ends with END. Observe that END is terminated with a semicolon. The executable section of a PL/SQL block can in turn include any number of PL/SQL blocks.
- Exception handling (optional): The exception section is nested within the executable section. This section begins with the keyword EXCEPTION.

In a PL/SQL block, the keywords DECLARE, BEGIN, and EXCEPTION are not terminated by a semicolon. However, the keyword END, all SQL statements, and PL/SQL statements must be terminated with a semicolon.

PL/SQL Block Structure (continued)

Section	Description	Inclusion
Declarative (DECLARE)	Contains declarations of all variables, constants, cursors, and user-defined exceptions that are referenced in the executable and exception sections.	Optional
Executable (BEGIN ... END)	Contains SQL statements to retrieve data from the database and PL/SQL statements to manipulate data in the block.	Mandatory
Exception (EXCEPTION)	Specifies the actions to perform when errors and abnormal conditions arise in the executable section.	Optional

Block Types

Anonymous

```
[DECLARE]  
  
BEGIN  
  --statements  
  
[EXCEPTION]  
  
END;
```

Procedure

```
PROCEDURE name  
IS  
  
BEGIN  
  --statements  
  
[EXCEPTION]  
  
END;
```

Function

```
FUNCTION name  
RETURN datatype  
IS  
  
BEGIN  
  --statements  
  RETURN value;  
[EXCEPTION]  
  
END;
```

ORACLE®

1-11

Copyright © 2004, Oracle. All rights reserved.

Block Types

A PL/SQL program comprises one or more blocks. These blocks can be entirely separate or nested within another. There are three types of blocks that make up a PL/SQL program.

They are:

- Anonymous blocks
- Procedures
- Functions

Anonymous blocks: Anonymous blocks are unnamed blocks. They are declared inline at the point in an application where they are to be executed and are compiled each time the application is executed. These blocks are not stored in the database. They are passed to the PL/SQL engine for execution at run time. Triggers in Oracle Developer components consist of such blocks. These anonymous blocks get executed at run time because they are inline. If you want to execute the same block again, you have to rewrite the block. You will not be able to invoke or call the block that you wrote earlier because blocks are anonymous and do not exist after they are executed.

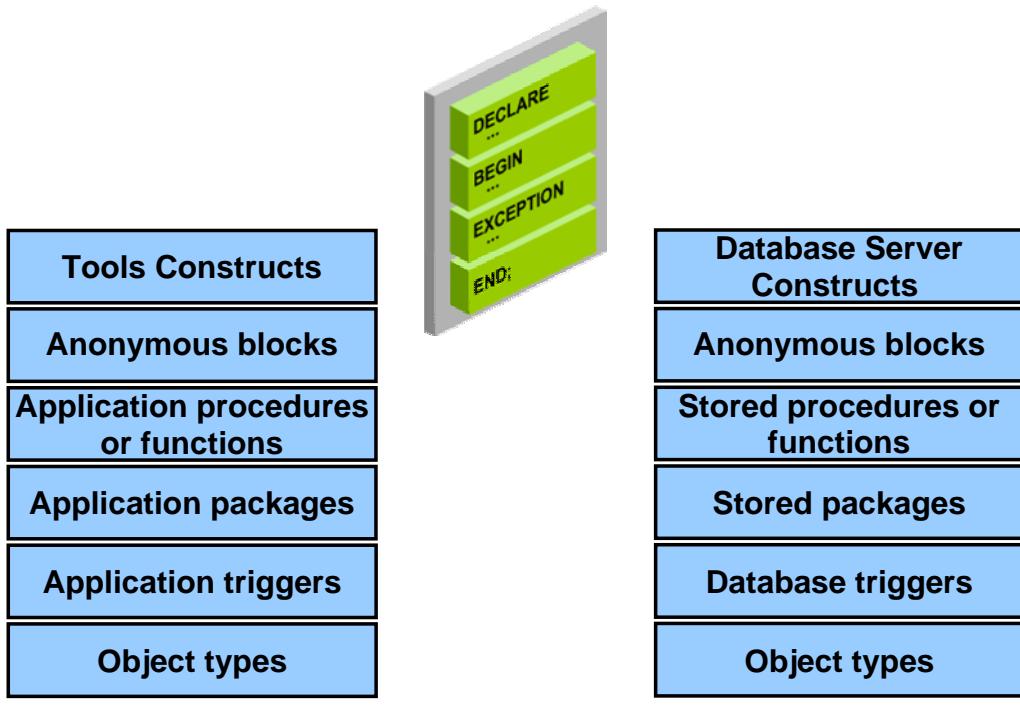

Block Types (continued)

Subprograms: Subprograms are complementary to anonymous blocks. They are named PL/SQL blocks that are stored in the database. Since they are named and stored you can invoke them whenever you want to depending on your application. You can declare them either as procedures or as functions. Generally use a procedure to perform an action and a function to compute and return a value.

You can store subprograms at the server or application level. Using Oracle Developer components (Forms, Reports) you can declare procedures and functions as part of the application (a form or report) and call them from other procedures, functions, and triggers within the same application whenever necessary.

Note: A function is similar to a procedure, except that a function *must* return a value.

Program Constructs

1-13

ORACLE

Program Constructs

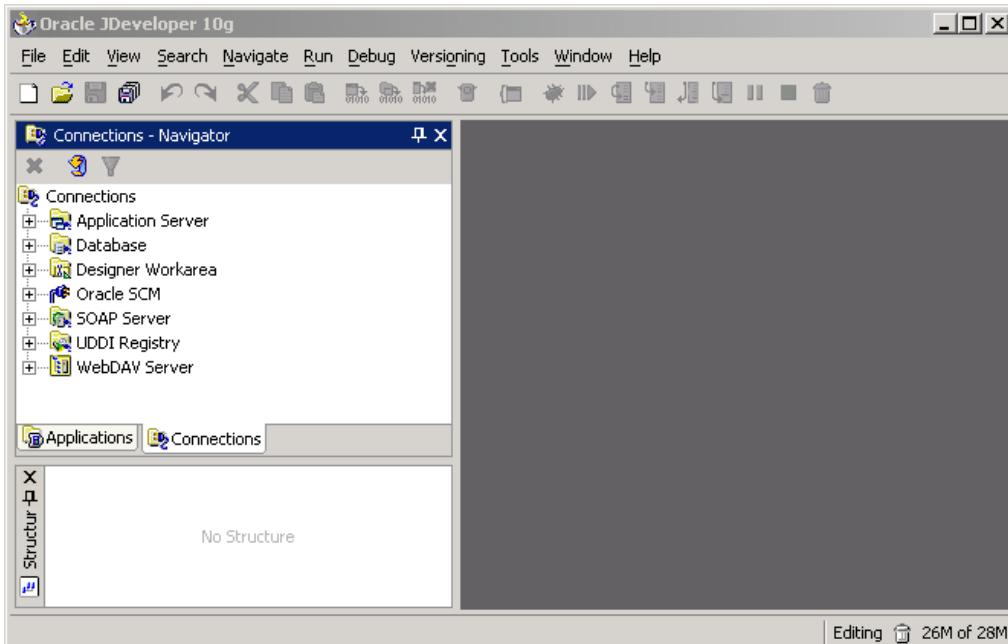

The following table outlines a variety of different PL/SQL program constructs that use the basic PL/SQL block. The program constructs are available based on the environment in which they are executed.

Program Construct	Description	Availability
Anonymous blocks	Unnamed PL/SQL blocks that are embedded within an application or are issued interactively	All PL/SQL environments
Application procedures or functions	Named PL/SQL blocks stored in an Oracle Forms Developer application or shared library; can accept parameters and can be invoked repeatedly by name	Oracle Developer tools components, for example, Oracle Forms Developer, Oracle Reports
Stored procedures or functions	Named PL/SQL blocks stored in the Oracle server; can accept parameters and can be invoked repeatedly by name	Oracle server or Oracle Developer tools
Packages (Application or Stored)	Named PL/SQL modules that group related procedures, functions, and identifiers	Oracle server and Oracle Developer tools components, for example, Oracle Forms Developer

Program Constructs (continued)

Program Construct	Description	Availability
Database triggers	PL/SQL blocks that are associated with a database table and fired automatically when triggered by various events	Oracle server or any Oracle tool that issues the DML
Application triggers	PL/SQL blocks that are associated either with a database table or system events. They are fired automatically when triggered by a DML or a system event respectively.	Oracle Developer tools components, for example, Oracle Forms Developer
Object types	User-defined composite data types that encapsulate a data structure along with the functions and procedures needed to manipulate the data	Oracle server and Oracle Developer tools

PL/SQL Programming Environments

1-15

PL/SQL Programming Environments

Oracle JDeveloper 10g: Oracle JDeveloper 10g is an Integrated Development Environment providing end-to-end support for building, testing, and deploying J2EE applications, Web services, and PL/SQL.

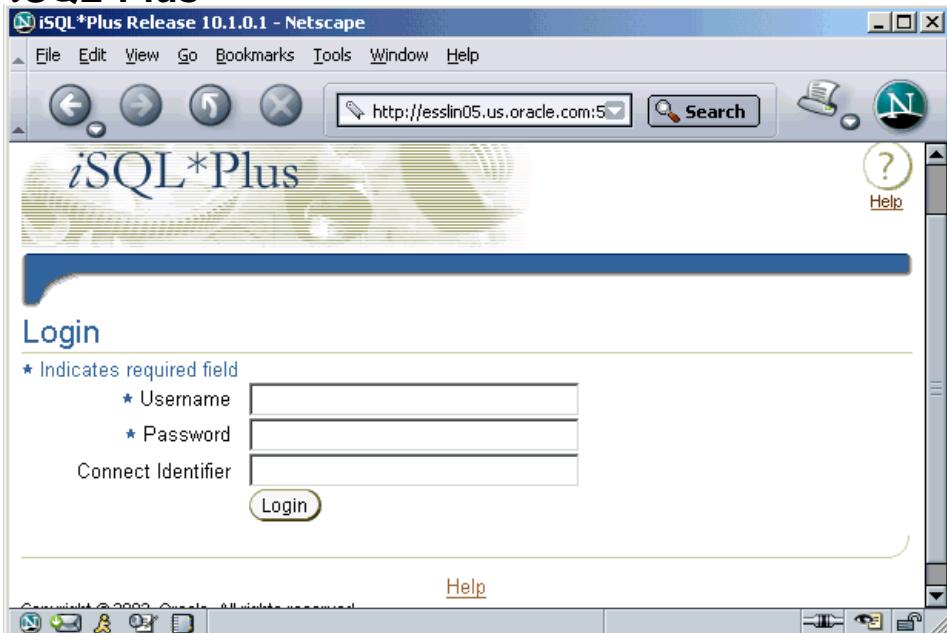

You can use Oracle JDeveloper 10g to do the following:

- Establish connection to the database with a user-friendly wizard
- Browse through the objects in the database you are connected to
- Create database users and objects
- Create, run, and debug PL/SQL programs such as procedures, functions, and packages

Note: Oracle JDeveloper 10g and iSQL*Plus can both be used as programming environments. However, this course uses iSQL*Plus for all demonstrations and practices.

PL/SQL Programming Environments

iSQL*Plus

1-16

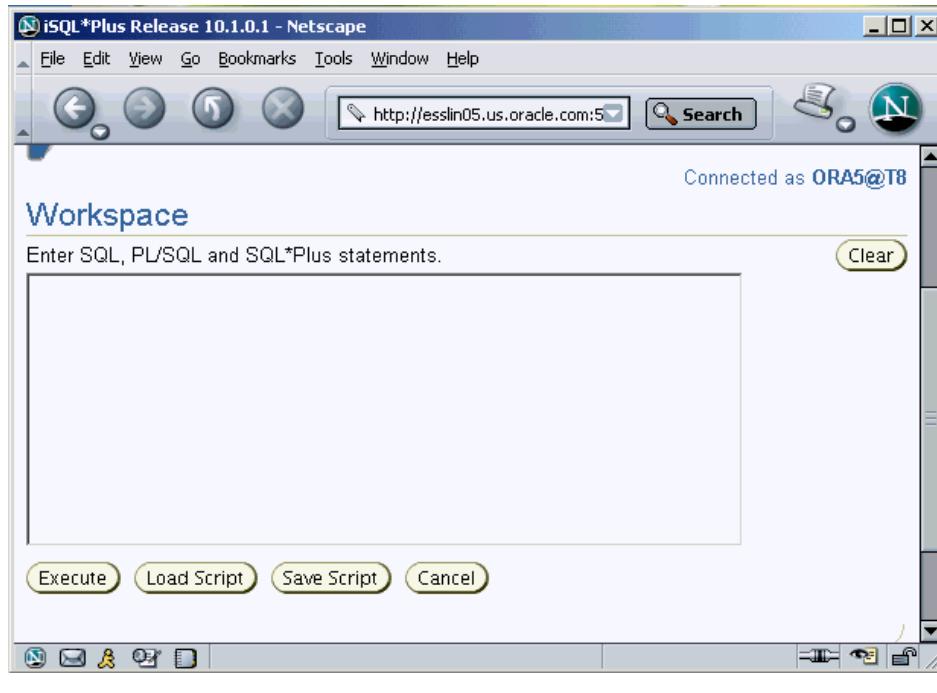

Copyright © 2004, Oracle. All rights reserved.

ORACLE

PL/SQL Programming Environments (continued)

iSQL*Plus: iSQL*Plus is a browser-based interface to SQL*Plus. You can connect to the local database or remote database by using the iSQL*Plus. It allows you to perform all the operations that you can perform with the command-line version of SQL*Plus.

PL/SQL Programming Environments

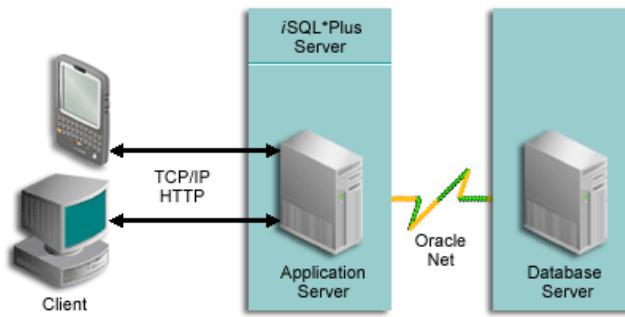

1-17

Copyright © 2004, Oracle. All rights reserved.

PL/SQL Programming Environments (continued)

When you log in to *iSQL*Plus*, you see the screen shown in the slide. Note that you have a workspace to enter SQL, PL/SQL, and SQL*Plus statements. Click the Execute button to execute your statements in the workspace. Click the Save Script button when you want to save all the commands in the workspace in a script file. You can save the script as a *.sql file. If you want to execute any script file, click the Load Script button and browse to select the script file. All the statements in the script file are loaded to the workspace and you can click the Execute button to execute the statements. The Clear button is used to clear the workspace.

iSQL*Plus Architecture

ORACLE®

1-18

Copyright © 2004, Oracle. All rights reserved.

iSQL*Plus Architecture

iSQL*Plus uses a three-tier model as shown in the slide. The three tiers in the architecture are:

- **Client tier:** The client is a typical HTTP client. Any browser connected to the intranet or Internet can access the iSQL*Plus user interface.
- **Middle tier:** The Application Server forms the middle tier in the iSQL*Plus architecture. The Application Server is installed when the database is installed. The iSQL*Plus server must be installed on the same machine as the Application Server. The middle tier is a Java2 Enterprise Edition (J2EE)-compliant application server. The Application Server enables communication between iSQL*Plus and the database. The three tiers in the architecture need not be on the same machine. However, the HTTP Server and iSQL*Plus Server should be on the same machine. iSQL*Plus manages a unique identity for each session. The advantage of this is that many concurrent users can use iSQL*Plus to access the database.
- **Database tier:** The database tier has the database server. The Oracle Net components enable communication between the iSQL*Plus Server and the database.

Create an Anonymous Block

Type the anonymous block in the *iSQL*Plus workspace*:

Workspace

Enter SQL, PL/SQL and SQL*Plus statements.

```
DECLARE
f_name VARCHAR(20);

BEGIN
SELECT first_name INTO f_name FROM employees WHERE
employee_id=100;
END;|
```

ORACLE®

1-19

Copyright © 2004, Oracle. All rights reserved.

Create an Anonymous Block

To create an anonymous block using *iSQL*Plus*, enter the block in the workspace as shown in the slide. The block has the declarative section and the executable section. You need not pay attention to the syntax of statements in the block. You will learn the syntax later in the course. The anonymous block gets the `first_name` of the employee whose `employee_id` is 100 and stores it in a variable called `f_name`.

Execute an Anonymous Block

Click the Execute button to execute the anonymous block:

Workspace

Enter SQL, PL/SQL and SQL*Plus statements.

```
DECLARE
f_name VARCHAR(20);

BEGIN
SELECT first_name INTO f_name FROM employees WHERE
employee_id=100;
END;|
```

Execute

Load Script

Save Script

Cancel

PL\SQL procedure successfully completed.

ORACLE®

Execute an Anonymous Block

Click the Execute button to execute the anonymous block in the workspace. Note that the message “PL/SQL procedure successfully completed” is displayed after the block is executed.

Test the Output of a PL/SQL Block

- **Enable output in iSQL*Plus with the command**
SET SERVEROUTPUT ON
- **Use a predefined Oracle package and its procedure:**
 - DBMS_OUTPUT.PUT_LINE

```
SET SERVEROUTPUT ON
...
DBMS_OUTPUT.PUT_LINE(' The First Name of the
Employee is ' || f_name);
...
```

ORACLE®

1-21

Copyright © 2004, Oracle. All rights reserved.

Test the Output of a PL/SQL Block

In the example shown in the previous slide, we have stored a value in the variable `f_name`. However, we have not printed the value. You will now learn how to print the value.

PL/SQL does not have input or output functionality built in it. Therefore, we use predefined Oracle packages for input and output. To generate output, you have to:

- Enable output in iSQL*Plus by using the `SET SERVEROUTPUT ON` command. `SET SERVEROUTPUT ON` is a SQL*Plus command that is also supported by iSQL*Plus.
- Use the procedure `PUT_LINE` of the package `DBMS_OUTPUT` to display the output. Pass the value that has to be printed as argument to this procedure as shown in the slide. The procedure will then output the arguments.

Test the Output of a PL/SQL Block

The screenshot shows the iSQL*Plus interface in Microsoft Internet Explorer. The title bar reads "iSQL*Plus Release 10.1.0.1 - Microsoft Internet Explorer". The menu bar includes File, Edit, View, Favorites, Tools, and Help. The tabs at the top are "Workspace" (selected) and "History". Below the tabs, it says "Connected as ORA5@T8". The main workspace area has a title "Workspace" and a sub-instruction "Enter SQL, PL/SQL and SQL*Plus statements.". A "Clear" button is located in the top right corner of this area. The code entered is:

```
SET SERVEROUTPUT ON
DECLARE
f_name VARCHAR(20);

BEGIN
SELECT first_name INTO f_name FROM employees WHERE
employee_id=100;
DBMS_OUTPUT.PUT_LINE('The First Name of the Employee is '||f_name);
```

Below the code are four buttons: "Execute", "Load Script", "Save Script", and "Cancel". The output window below displays the results:

```
The First Name of the Employee is Steven
PL/SQL procedure successfully completed.
```

At the bottom of the window, there are several small icons and the text "Local intranet".

1-22

ORACLE®

Test the Output of a PL/SQL Block (continued)

The slide shows the output of the PL/SQL block after the inclusion of the code for generating output.

Summary

In this lesson, you should have learned how to:

- **Integrate SQL statements with PL/SQL program constructs**
- **Identify the benefits of PL/SQL**
- **Differentiate different PL/SQL block types**
- **Use iSQL*Plus as the programming environment for PL/SQL**
- **Output messages in PL/SQL**

ORACLE®

1-23

Summary

PL/SQL is a language that has programming features that serve as an extension to SQL. SQL, which is a nonprocedural language, is made procedural with PL/SQL programming constructs. PL/SQL applications can run on any platform or operating system on which Oracle server runs. In this lesson, you have learned to build basic PL/SQL blocks.

Practice 1: Overview

This practice covers the following topics:

- **Identifying which PL/SQL blocks execute successfully**
- **Creating and executing a simple PL/SQL block**

Practice 1: Overview

This practice reinforces the basics of PL/SQL covered in this lesson.

- Question 1 is paper-based question which lets you identify PL/SQL blocks that execute successfully.
- Question 2 involves creating and executing a simple PL/SQL block.

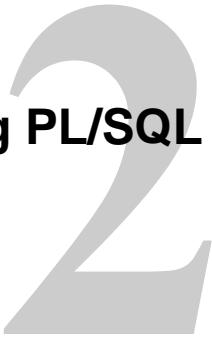

Practice 1

Before you begin this practice, please ensure that you have seen both the viewlets on *iSQL*Plus* usage.

The `labs` folder will be your working directory. You can save your scripts in the `labs` folder. Please take the instructor's help to locate the `labs` folder for this course. The solutions for all practices are in the `soln` folder.

1. Which of the following PL/SQL blocks execute successfully?
 - a. BEGIN
END;
 - b. DECLARE
amount INTEGER(10);
END;
 - c. DECLARE
BEGIN
END;
 - d. DECLARE
amount INTEGER(10);
BEGIN
DBMS_OUTPUT.PUT_LINE(amount);
END;
2. Create and execute a simple anonymous block that outputs "Hello World." Execute and save this script as `lab_01_02_soln.sql`.

Declaring PL/SQL Variables

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- **Identify valid and invalid identifiers**
- **List the uses of variables**
- **Declare and initialize variables**
- **List and describe various data types**
- **Identify the benefits of using %TYPE attribute**
- **Declare, use, and print bind variables**

ORACLE®

2-2

Copyright © 2004, Oracle. All rights reserved.

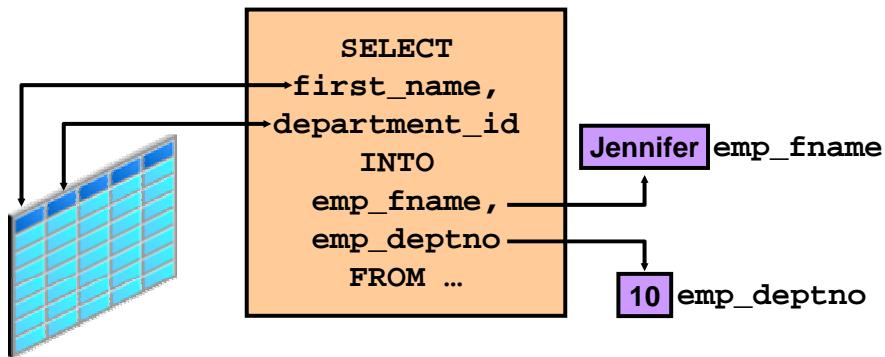

Lesson Aim

You have learned about a basic PL/SQL block and its sections. In this lesson, you learn about valid and invalid identifiers. You learn how to declare and initialize variables in the declarative section of a PL/SQL block. This lesson describes the various data types. You will also learn the %TYPE attribute and its benefits.

Use of Variables

Variables can be used for:

- Temporary storage of data
- Manipulation of stored values
- Reusability

Use of Variables

With PL/SQL you can declare variables and then use them in SQL and procedural statements.

Why Use Variables?

Variables are mainly used for storage of data and manipulation of stored values. Consider the SQL statement shown in the slide. The statement is retrieving the `first_name` and `department_id` from the table. If you have to manipulate the `first_name` or the `department_id`, then you have to store the retrieved value. Variables are used to temporarily store the value. You can use the value stored in these variables for processing/manipulating the data. Therefore, the variables are used for **storing** and **manipulating** data. Variables can store any PL/SQL object such as variables, types, cursors, and subprograms.

Reusability is another advantage of declaring variables. After they are declared, variables can be used repeatedly in an application by referring to them in the statements.

Identifiers

Identifiers are used for:

- **Naming a variable**
- **Providing a convention for variable names:**
 - Must start with a letter
 - Can include letters or numbers
 - Can include special characters such as dollar sign, underscore, and pound sign
 - Must limit the length to 30 characters
 - Must not be reserved words

ORACLE®

2-4

Copyright © 2004, Oracle. All rights reserved.

Identifiers

Identifiers are mainly used to make a convention for naming variables. The rules for naming a variable are listed in the slide.

What Is the Difference Between a Variable and an Identifier?

Identifiers are names of variables. Variables are storage locations of data. Data is stored in memory. Variables point to this memory location from where data can be read and modified. Identifiers are used to *name* any PL/SQL object such as variables, types, cursors, and subprograms. Variables are used to *store* any PL/SQL object such as variables, types, cursors, and subprograms.

Handling Variables in PL/SQL

Variables are:

- Declared and initialized in the declarative section
- Used and assigned new values in the executable section
- Passed as parameters to PL/SQL subprograms
- Used to hold the output of a PL/SQL subprogram

ORACLE®

2-5

Copyright © 2004, Oracle. All rights reserved.

Handling Variables in PL/SQL

Declared and Initialized in the Declaration Section

You can declare variables in the declarative part of any PL/SQL block, subprogram, or package. Declarations allocate storage space for a value, specify its data type, and name the storage location so that you can reference it. Declarations can also assign an initial value and impose the NOT NULL constraint on the variable. Forward references are not allowed. You must declare a variable before referencing it in other statements, including other declarative statements.

Used and Assigned New Values in the Executable Section

In the executable section, the existing value of the variable can be replaced with the new value.

Passed as Parameters to PL/SQL Subprograms

Subprograms can take parameters. You can pass variables as parameters to subprograms.

Used to Hold the Output of a PL/SQL Subprogram

You have learned that procedures and functions are the same except that the functions must return a value. Variables can be used to hold the value that is returned by a function.

Declaring and Initializing PL/SQL Variables

Syntax:

```
identifier [CONSTANT] datatype [NOT NULL]  
[ := | DEFAULT expr];
```

Examples:

```
DECLARE  
    emp_hiredate      DATE;  
    emp_deptno        NUMBER(2) NOT NULL := 10;  
    location          VARCHAR2(13) := 'Atlanta';  
    c_comm            CONSTANT NUMBER := 1400;
```

ORACLE®

2-6

Copyright © 2004, Oracle. All rights reserved.

Declaring and Initializing PL/SQL Variables

You must declare all PL/SQL identifiers in the declaration section before referencing them in the PL/SQL block. You have the option to assign an initial value to a variable as shown in the slide. You do not need to assign a value to a variable in order to declare it. If you refer to other variables in a declaration, you must be sure to declare them separately in a previous statement.

In the syntax:

- | | |
|-------------------|--|
| <i>identifier</i> | Is the name of the variable |
| CONSTANT | Constrains the variable so that its value cannot change; constants must be initialized. |
| <i>data type</i> | Is a scalar, composite, reference, or LOB data type. (This course covers only scalar, composite, and LOB data types.) |
| NOT NULL | Constrains the variable so that it must contain a value. (NOT NULL variables must be initialized.) |
| <i>expr</i> | Is any PL/SQL expression that can be a literal expression, another variable, or an expression involving operators and functions. |

Note: In addition to variables, you can also declare cursors and exceptions in the declarative section. You will learn how to declare cursors and exceptions later in the course.

Declaring and Initializing PL/SQL Variables

1

```
SET SERVEROUTPUT ON
DECLARE
    Myname VARCHAR2(20);
BEGIN
    DBMS_OUTPUT.PUT_LINE('My name is: ' || Myname);
    Myname := 'John';
    DBMS_OUTPUT.PUT_LINE('My name is: ' || Myname);
END;
/
```

2

```
SET SERVEROUTPUT ON
DECLARE
    Myname VARCHAR2(20) := 'John';
BEGIN
    Myname := 'Steven';
    DBMS_OUTPUT.PUT_LINE('My name is: ' || Myname);
END;
/
```

ORACLE

2-7

Copyright © 2004, Oracle. All rights reserved.

Declaring and Initializing PL/SQL Variables (continued)

Observe the two code blocks in the slide.

1. The variable Myname is declared in the declarative section of the block. This variable can be accessed in the executable section of the same block. A value John is assigned to the variable in the executable section. String literals must be enclosed in single quotation marks. If your string has a quotation mark as in “ Today’s Date”, then the string would be 'Today' 's Date'. ‘:=’ is the assignment operator. The procedure PUT_LINE is invoked by passing the variable Myname. The value of the variable is concatenated with the string ‘My name is: ‘. The output of this anonymous block is:
My name is:
My name is: John
PL/SQL procedure successfully completed.
2. In this block, the variable Myname is declared and initialized in the declarative section. Myname will hold the value John after initialization. Note that this value is manipulated in the executable section of the block. The output of this anonymous block is:
My name is: Steven
PL/SQL procedure successfully completed.

Delimiters in String Literals

```
SET SERVEROUTPUT ON
DECLARE
    event VARCHAR2(15);
BEGIN
    event := q'!Father's day!';
    DBMS_OUTPUT.PUT_LINE('3rd Sunday in June is :
    ' || event);
    event := q'[Mother's day]';
    DBMS_OUTPUT.PUT_LINE('2nd Sunday in May is :
    ' || event);
END;
/
```

3rd Sunday in June is : Father's day
2nd Sunday in May is : Mother's day
PL/SQL procedure successfully completed.

ORACLE®

2-8

Copyright © 2004, Oracle. All rights reserved.

Delimiters in String Literals

If your string contains a single quote, then you double the quotation mark.
For example,

```
event VARCHAR2(15) := 'Father''s day';
```

The first quotation mark acts as the escape character. This makes your string complicated especially if you have SQL statements as strings. You can specify any character that is not present in the string as delimiter. The slide shows how to use the q' notation to specify the delimiter. The examples use '!' and '[' as delimiters. Consider the following example:

```
event := q'!Father's day!';
```

You can compare this with the first example on this notes page. You start the string with q' if you want to use a delimiter. The character following the notation is the delimiter used. Enter your string after specifying the delimiter, close the delimiter, and close the notation with a single quote. The following example shows how to use '[' as delimiter.

```
event := q' [Mother's day] ';
```

Types of Variables

- **PL/SQL variables:**
 - Scalar
 - Composite
 - Reference
 - Large objects (LOB)
- **Non-PL/SQL variables: Bind variables**

ORACLE®

2-9

Copyright © 2004, Oracle. All rights reserved.

Types of Variables

All PL/SQL variables have a data type, which specifies a storage format, constraints, and a valid range of values. PL/SQL supports five data type categories—scalar, composite, reference, large objects (LOB), and object—that you can use for declaring variables, constants, and pointers.

- **Scalar data types:** Scalar data types hold a single value. The value depends on the data type of the variable. For example, the variable Myname in the example in the slide 7 is of type VARCHAR2. Therefore, Myname can hold a string value. PL/SQL also supports Boolean variables.
- **Composite data types:** Composite data types contain internal elements that are either scalar or composite. Record and table are examples of composite data types.
- **Reference data types:** Reference data types hold values, called pointers, that point to a storage location.
- **LOB data types:** LOB data types hold values, called locators, that specify the location of large objects (such as graphic images) that are stored out of line.

Non-PL/SQL variables include host language variables declared in precompiler programs, screen fields in Forms applications, and iSQL*Plus host variables. You learn about host variables later in the lesson.

For more information about LOBs, see *PL/SQL User's Guide and Reference*.

Types of Variables

TRUE

25-JAN-01

The soul of the lazy man
desires, and has nothing;
but the soul of the diligent
shall be made rich.

256120.08

Atlanta

ORACLE®

Types of Variables (continued)

The slide illustrates the following data types:

- TRUE represents a Boolean value.
- 25-JAN-01 represents a DATE.
- The image represents a BLOB.
- The text of the proverb can represent a VARCHAR2 datatype or a CLOB.
- 256120.08 represents a NUMBER data type with precision and scale.
- The movie represents a BFILE.
- The city name, Atlanta, represents a VARCHAR2.

Guidelines for Declaring and Initializing PL/SQL Variables

- Follow naming conventions.
- Use meaningful names for variables.
- Initialize variables designated as NOT NULL and CONSTANT.
- Initialize variables with the assignment operator (:=) or the DEFAULT keyword:

```
Myname VARCHAR2(20) := 'John' ;
```

```
Myname VARCHAR2(20) DEFAULT 'John' ;
```

- Declare one identifier per line for better readability and code maintenance.

ORACLE®

2-11

Copyright © 2004, Oracle. All rights reserved.

Guidelines for Declaring and Initializing PL/SQL Variables

Here are some guidelines to follow while declaring PL/SQL variables:

- Follow naming conventions—for example, name to represent a variable and c_name to represent a constant.
- Use meaningful and appropriate names for variables. For example, consider using salary and sal_with_commission instead of salary1 and salary2.
- If you use the NOT NULL constraint, you must assign a value when you are declaring the variable.
- In constant declarations, the keyword CONSTANT must precede the type specifier. The following declaration names a constant of NUMBER subtype REAL and assigns the value of 50000 to the constant. A constant must be initialized in its declaration; otherwise, you get a compilation error. After initializing a constant, you cannot change its value.

```
sal CONSTANT REAL := 50000.00;
```

Guidelines for Declaring PL/SQL Variables

- **Avoid using column names as identifiers.**

```
DECLARE
    employee_id  NUMBER(6);
BEGIN
    SELECT    employee_id
    INTO      employee_id
    FROM      employees
    WHERE     last_name = 'Kochhar';
END;
/
```

- **Use the NOT NULL constraint when the variable must hold a value.**

ORACLE®

2-12

Copyright © 2004, Oracle. All rights reserved.

Guidelines for Declaring PL/SQL Variables

- Initialize the variable to an expression with the assignment operator (:=) or with the DEFAULT reserved word. If you do not assign an initial value, the new variable contains NULL by default until you assign a value. To assign or reassign a value to a variable, you write a PL/SQL assignment statement. It is a good programming practice to initialize all variables.
- Two objects can have the same name, provided they are defined in different blocks. Where they coexist, you can qualify them with labels and use them.
- Avoid using column names as identifiers. If PL/SQL variables occur in SQL statements and have the same name as a column, the Oracle server assumes that it is the column that is being referenced. Although the example code in the slide works, code that is written using the same name for a database table and variable name is not easy to read or maintain.
- Impose the NOT NULL constraint when the variable must contain a value. You cannot assign nulls to a variable defined as NOT NULL. The NOT NULL constraint must be followed by an initialization clause.

```
pincode NUMBER(15) NOT NULL := 'Oxford';
```

Scalar Data Types

- Hold a single value
- Have no internal components

TRUE

25-JAN-01

256120.08

Atlanta

The soul of the lazy man
desires, and has nothing;
but the soul of the diligent
shall be made rich.

Scalar Data Types

Every constant, variable, and parameter has a data type (or type), which specifies a storage format, constraints, and valid range of values. PL/SQL provides a variety of predefined data types. For instance, you can choose from integer, floating point, character, Boolean, date, collection, and LOB types. This chapter covers the basic types that are used frequently in PL/SQL programs.

A scalar data type holds a single value and has no internal components. Scalar data types can be classified into four categories: number, character, date, and Boolean. Character and number data types have subtypes that associate a base type to a constraint. For example, INTEGER and POSITIVE are subtypes of the NUMBER base type.

For more information and the complete list of scalar data types, refer to *PL/SQL User's Guide and Reference*.

Base Scalar Data Types

- **CHAR [(maximum_length)]**
- **VARCHAR2 (maximum_length)**
- **LONG**
- **LONG RAW**
- **NUMBER [(precision, scale)]**
- **BINARY_INTEGER**
- **PLS_INTEGER**
- **BOOLEAN**
- **BINARY_FLOAT**
- **BINARY_DOUBLE**

ORACLE®

2-14

Copyright © 2004, Oracle. All rights reserved.

Base Scalar Data Types

Data Type	Description
CHAR [(maximum_length)]	Base type for fixed-length character data up to 32,767 bytes. If you do not specify a <i>maximum_length</i> , the default length is set to 1.
VARCHAR2 (maximum_length)	Base type for variable-length character data up to 32,767 bytes. There is no default size for VARCHAR2 variables and constants.
NUMBER [(precision, scale)]	Number having precision <i>p</i> and scale <i>s</i> . The precision <i>p</i> can range from 1 to 38. The scale <i>s</i> can range from -84 to 127.
BINARY_INTEGER	Base type for integers between -2,147,483,647 and 2,147,483,647.

Base Scalar Data Types (continued)

Data Type	Description
PLS_INTEGER	Base type for signed integers between -2,147,483,647 and 2,147,483,647. PLS_INTEGER values require less storage and are faster than NUMBER and BINARY_INTEGER values. The arithmetic operations on PLS_INTEGER and BINARY_INTEGER values are faster than on NUMBER values.
BOOLEAN	Base type that stores one of the three possible values used for logical calculations: TRUE, FALSE, or NULL.
BINARY_FLOAT	New data type introduced in Oracle Database 10g. Represents floating-point number in IEEE 754 format. Requires 5 bytes to store the value.
BINARY_DOUBLE	New data type introduced in Oracle Database 10g. Represents floating-point number in IEEE 754 format. Requires 9 bytes to store the value.

Base Scalar Data Types

- **DATE**
- **TIMESTAMP**
- **TIMESTAMP WITH TIME ZONE**
- **TIMESTAMP WITH LOCAL TIME ZONE**
- **INTERVAL YEAR TO MONTH**
- **INTERVAL DAY TO SECOND**

ORACLE®

2-16

Copyright © 2004, Oracle. All rights reserved.

Base Scalar Data Types (continued)

Data Type	Description
DATE	Base type for dates and times. DATE values include the time of day in seconds since midnight. The range for dates is between 4712 B.C. and 9999 A.D.
TIMESTAMP	The TIMESTAMP data type, which extends the DATE data type, stores the year, month, day, hour, minute, and second, and fraction of seconds. The syntax is: <code>TIMESTAMP[(precision)]</code> where the optional parameter <code>precision</code> specifies the number of digits in the fractional part of the seconds field. You cannot use a symbolic constant or variable to specify the precision; you must use an integer literal in the range 0 .. 9. The default is 6.
TIMESTAMP WITH TIME ZONE	The TIMESTAMP WITH TIME ZONE data type, which extends the TIMESTAMP data type, includes a time-zone displacement. The time-zone displacement is the difference (in hours and minutes) between local time and Coordinated Universal Time (UTC), formerly known as Greenwich Mean Time. The syntax is: <code>TIMESTAMP[(precision)] WITH TIME ZONE</code> where the optional parameter <code>precision</code> specifies the number of digits in the fractional part of the seconds field. You cannot use a symbolic constant or variable to specify the precision; you must use an integer literal in the range 0 .. 9. The default is 6.

Base Scalar Data Types (continued)

Data Type	Description
TIMESTAMP WITH LOCAL TIME ZONE	<p>The TIMESTAMP WITH LOCAL TIME ZONE data type, which extends the TIMESTAMP data type, includes a time-zone displacement. The time-zone displacement is the difference (in hours and minutes) between local time and Coordinated Universal Time (UTC)—formerly Greenwich Mean Time. The syntax is:</p> <p><code>TIMESTAMP[(precision)] WITH LOCAL TIME ZONE</code></p> <p>where the optional parameter precision specifies the number of digits in the fractional part of the seconds field. You cannot use a symbolic constant or variable to specify the precision; you must use an integer literal in the range 0 .. 9. The default is 6.</p> <p>This data type differs from TIMESTAMP WITH TIME ZONE in that when you insert a value into a database column, the value is normalized to the database time zone, and the time-zone displacement is not stored in the column. When you retrieve the value, Oracle server returns the value in your local session time zone.</p>
INTERVAL YEAR TO MONTH	<p>You use the INTERVAL YEAR TO MONTH data type to store and manipulate intervals of years and months. The syntax is:</p> <p><code>INTERVAL YEAR[(precision)] TO MONTH</code></p> <p>where precision specifies the number of digits in the years field. You cannot use a symbolic constant or variable to specify the precision; you must use an integer literal in the range 0 .. 4. The default is 2.</p>
INTERVAL DAY TO SECOND	<p>You use the INTERVAL DAY TO SECOND data type to store and manipulate intervals of days, hours, minutes, and seconds. The syntax is:</p> <p><code>INTERVAL DAY[(precision1)] TO SECOND[(precision2)]</code></p> <p>where precision1 and precision2 specify the number of digits in the days field and seconds field, respectively. In both cases, you cannot use a symbolic constant or variable to specify the precision; you must use an integer literal in the range 0 .. 9. The defaults are 2 and 6, respectively.</p>

BINARY_FLOAT and BINARY_DOUBLE

- Represent floating point numbers in IEEE (Institute of Electrical and Electronics Engineers) 754 format
- Offer better interoperability and operational speed
- Store values beyond the values that the data type NUMBER can store
- Offer benefits of closed arithmetic operations and transparent rounding

ORACLE®

2-18

Copyright © 2004, Oracle. All rights reserved.

BINARY_FLOAT and BINARY_DOUBLE

BINARY_FLOAT and BINARY_DOUBLE are new data types introduced in Oracle database 10g.

Represent floating point numbers in IEEE 754 format: You can use these data types for scientific calculations and also for data exchange between programs that follow the IEEE format.

Benefits: Many computer systems support IEEE 754 floating-point operations through native processor instructions. These types are efficient for intensive computations involving floating-point data. Interaction with such programs is made easier because Oracle supports the same format to which these two data types adhere.

Better interoperability and operational speed: Interoperability is mainly due to the format of these two data types. These data types improve performance in number-crunching operations such as processing scientific data.

Store values beyond Oracle NUMBER: BINARY_FLOAT requires 5 bytes and BINARY_DOUBLE requires 9 bytes as opposed to Oracle NUMBER using anywhere between 1 and 22 bytes. These data types meet the demand for a numeric data type that can store numeric data beyond the range of NUMBER.

BINARY_FLOAT and BINARY_DOUBLE (continued)

Closed arithmetic operations and transparent rounding: All arithmetic operations with BINARY_FLOAT and BINARY_DOUBLE are closed, that is, an arithmetic operation produces a normal or special value. You need not worry about explicit conversion. For example, multiplying a BINARY_FLOAT number with another BINARY_FLOAT results in a BINARY_FLOAT number. Dividing a BINARY_FLOAT by zero is undefined and actually results in the special value Inf (Infinite). Operations on these data types are subject to rounding, which is transparent to PL/SQL users. The default mode is rounding to the nearest binary place. Most financial applications require decimal rounding behavior, whereas purely scientific applications may not.

Example:

```
SET SERVEROUTPUT ON
DECLARE
    bf_var BINARY_FLOAT;
    bd_var BINARY_DOUBLE;
BEGIN
    bf_var := 270/35f;
    bd_var := 140d/0.35;
    DBMS_OUTPUT.PUT_LINE('bf: ' || bf_var);
    DBMS_OUTPUT.PUT_LINE('bd: ' || bd_var);
END;
/
bf: 7.71428585E+000
bd: 4.0E+002
PL/SQL procedure successfully completed.
```

Declaring Scalar Variables

Examples:

```
DECLARE
    emp_job      VARCHAR2(9);
    count_loop   BINARY_INTEGER := 0;
    dept_total_sal NUMBER(9,2) := 0;
    orderdate    DATE := SYSDATE + 7;
    c_tax_rate   CONSTANT NUMBER(3,2) := 8.25;
    valid        BOOLEAN NOT NULL := TRUE;
    ...
```

Declaring Scalar Variables

The examples of variable declaration shown in the slide are defined as follows:

- `emp_job`: Variable to store an employee job title
- `count_loop`: Variable to count the iterations of a loop and initialized to 0
- `dept_total_sal`: Variable to accumulate the total salary for a department and initialized to 0
- `orderdate`: Variable to store the ship date of an order and initialize to one week from today
- `c_tax_rate`: A constant variable for the tax rate, which never changes throughout the PL/SQL block and is set to 8.25
- `valid`: Flag to indicate whether a piece of data is valid or invalid and initialized to TRUE

The %TYPE Attribute

The %TYPE attribute

- Is used to declare a variable according to:
 - A database column definition
 - Another declared variable
- Is prefixed with:
 - The database table and column
 - The name of the declared variable

ORACLE®

2-21

Copyright © 2004, Oracle. All rights reserved.

The %TYPE Attribute

Generally PL/SQL variables are declared to hold and manipulate data stored in a database. When you declare PL/SQL variables to hold column values, you must ensure that the variable is of the correct data type and precision. If it is not, a PL/SQL error will occur during execution. If you have to design large subprograms, then this can be time-consuming and error-prone.

Rather than hard coding the data type and precision of a variable, you can use the %TYPE attribute to declare a variable according to another previously declared variable or database column. The %TYPE attribute is most often used when the value stored in the variable will be derived from a table in the database. When you use the %TYPE attribute to declare a variable, you should prefix it with the database table and column name. If you refer to a previously declared variable, prefix the variable name to the attribute.

The %TYPE Attribute (continued)

Advantages of the %TYPE Attribute

- You can avoid errors caused by data type mismatch or wrong precision.
- You can avoid hard coding the data type of a variable.
- You need not change the variable declaration if the column definition changes. If you have already declared some variables for a particular table without using the %TYPE attribute, then the PL/SQL block may throw errors if the column for which the variable is declared is altered. When you use the %TYPE attribute, PL/SQL determines the data type and size of the variable when the block is compiled. This ensures that such a variable is always compatible with the column that is used to populate it.

Declaring Variables with the %TYPE Attribute

Syntax:

```
identifier      table.column_name%TYPE;
```

Examples:

```
...
emp_lname      employees.last_name%TYPE;
balance        NUMBER(7,2);
min_balance    balance%TYPE := 1000;
...
```

ORACLE®

2-23

Copyright © 2004, Oracle. All rights reserved.

Declaring Variables with the %TYPE Attribute

Declare variables to store the last name of an employee. The variable `emp_lname` is defined to be of the same data type as the `last_name` column in the `employees` table. The `%TYPE` attribute provides the data type of a database column.

Declare variables to store the balance of a bank account, as well as the minimum balance, which is 1000. The variable `min_balance` is defined to be of the same data type as the variable `balance`. The `%TYPE` attribute provides the data type of a variable.

A NOT NULL database column constraint does not apply to variables that are declared using `%TYPE`. Therefore, if you declare a variable using the `%TYPE` attribute that uses a database column defined as NOT NULL, you can assign the NULL value to the variable.

Declaring Boolean Variables

- Only the values TRUE, FALSE, and NULL can be assigned to a Boolean variable.
- Conditional expressions use logical operators AND, OR, and unary operator NOT to check the variable values.
- The variables always yield TRUE, FALSE, or NULL.
- Arithmetic, character, and date expressions can be used to return a Boolean value.

ORACLE®

2-24

Copyright © 2004, Oracle. All rights reserved.

Declaring Boolean Variables

With PL/SQL, you can compare variables in both SQL and procedural statements. These comparisons, called Boolean expressions, consist of simple or complex expressions separated by relational operators. In a SQL statement, you can use Boolean expressions to specify the rows in a table that are affected by the statement. In a procedural statement, Boolean expressions are the basis for conditional control. NULL stands for a missing, inapplicable, or unknown value.

Examples

```
emp_sal1 := 50000;  
emp_sal2 := 60000;
```

The following expression yields TRUE:

```
emp_sal1 < emp_sal2
```

Declare and initialize a Boolean variable:

```
DECLARE  
    flag BOOLEAN := FALSE;  
BEGIN  
    flag := TRUE;  
END;  
/
```

Bind Variables

Bind variables are:

- **Created in the environment**
- **Also called host variables**
- **Created with the VARIABLE keyword**
- **Used in SQL statements and PL/SQL blocks**
- **Accessed even after the PL/SQL block is executed**
- **Referenced with a preceding colon**

ORACLE®

2-25

Copyright © 2004, Oracle. All rights reserved.

Bind Variables

Bind variables are variables that you create in a host environment. They are also called host variables.

Why Do You Need Bind Variables?

Bind variables are created in the environment and not in the declarative section of a PL/SQL block. Variables declared in a PL/SQL block are available only when you execute the block. After the block is executed, the memory used by the variable is freed. However, bind variables are accessible even after the block is executed. Therefore, when created, bind variables can be used and manipulated by multiple subprograms. They can be used in SQL statements and PL/SQL blocks just like any other variable. These variables can be passed as run-time values into or out of PL/SQL subprograms.

How to Create Bind Variables?

To create a bind variable in iSQL*Plus or in SQL*Plus, use the command VARIABLE. For example, you declare a variable of type NUMBER and VARCHAR2 as follows:

```
VARIABLE return_code NUMBER  
VARIABLE return_msg VARCHAR2( 30 )
```

Both SQL*Plus and iSQL*Plus can reference the bind variable, and iSQL*Plus can display its value through the iSQL*Plus PRINT command. The PRINT command is a SQL*Plus command.

Bind Variables (continued)

How to Use Bind Variables?

You can reference bind variables in PL/SQL programs by preceding the variable with a colon:

```
VARIABLE result NUMBER
BEGIN
    SELECT (SALARY*12) + NVL(COMMISSION_PCT,0) INTO :result
    FROM employees WHERE employee_id = 144;
END;
/
PRINT result
```

RESULT

30000

Note: If you are creating a bind variable of type NUMBER, you cannot specify the precision and scale. However, you can specify the size for character strings. An Oracle NUMBER is stored in the same way regardless of the dimension. The Oracle server uses the same number of bytes to store 7, 70, and .0734. It is not practical to calculate the size of the Oracle number representation from the number format, so the code always allocates the bytes needed. With character strings the size is required from the user so that the required number of bytes can be allocated.

How to Print Bind Variables from the Environment?

To display the current value of bind variables in the *iSQL*Plus* environment, use the PRINT command. However, PRINT cannot be used inside a PL/SQL block because it is an *iSQL*Plus* command. Note how the variable `result` is printed using the PRINT command in the code block shown above.

Printing Bind Variables

Example:

```
VARIABLE emp_salary NUMBER
BEGIN
    SELECT salary INTO :emp_salary
    FROM employees WHERE employee_id = 178;
END;
/
PRINT emp_salary
SELECT first_name, last_name FROM employees
WHERE salary=:emp_salary;
```

ORACLE®

2-27

Copyright © 2004, Oracle. All rights reserved.

Printing Bind Variables

In iSQL*Plus you can display the value of the bind variable using the PRINT command. When you execute the PL/SQL block shown in the slide, you get the following output when the PRINT command executes.

EMP_SALARY

7000

emp_salary is a bind variable. You can now use this variable in any SQL statement or PL/SQL program. Note the SQL statement that uses the bind variable. The output of the SQL statement is:

FIRST_NAME	LAST_NAME
Oliver	Tuvault
Sarath	Sewall
Kimberely	Grant

Note: You can use PRINT command without any variable to display all bind variables.

Printing Bind Variables

Example:

```
VARIABLE emp_salary NUMBER
SET AUTOPRINT ON
BEGIN
    SELECT salary INTO :emp_salary
    FROM employees WHERE employee_id = 178;
END;
/
```

Printing Bind Variables (continued)

Use the command SET AUTOPRINT ON to automatically display the bind variables used in a successful PL/SQL block.

Substitution Variables

- Are used to get user input at run time
- Are referenced within a PL/SQL block with a preceding ampersand
- Are used to avoid hard coding values that can be obtained at run time

```
VARIABLE emp_salary NUMBER
SET AUTOPRINT ON
DECLARE
    empno NUMBER(6):=&empno;
BEGIN
    SELECT salary INTO :emp_salary
    FROM employees WHERE employee_id = empno;
END;
/
```

ORACLE®

2-29

Copyright © 2004, Oracle. All rights reserved.

Substitution Variables

In the *iSQL*Plus* environment, *iSQL*Plus* substitution variables can be used to pass run-time values into a PL/SQL block. You can reference substitution variables in SQL statements and within a PL/SQL block with a preceding ampersand. The text values are substituted into the PL/SQL block before the PL/SQL block is executed. Therefore, you cannot substitute different values for the substitution variables by using a loop. Even if you include the variable in a loop, you are prompted only once to enter the value. Only one value will replace the substitution variable.

When you execute the above block, *iSQL*Plus* prompts you to enter a value for `empno`, which is the substitution variable.

Substitution Variables

The figure consists of three vertically stacked windows from the iSQL*Plus application. Each window has a purple circle with a number to its right, indicating a step in a process.

- Step 1:** A dialog box titled "Input Required" with a blue info icon. It contains a prompt "Enter value for empno:" followed by a text input field containing "100". At the bottom are "Cancel" and "Continue" buttons. A purple circle with the number "1" is to the right of the window.
- Step 2:** The output window shows the execution of a PL/SQL block. The output text is:

```
old 2: empno NUMBER(6):=&empno;
new 2: empno NUMBER(6):=100;
PL/SQL procedure successfully completed.
```

A green bar at the bottom is labeled "EMP_SALARY" and shows the value "24000". A purple circle with the number "2" is to the right of the window.
- Step 3:** The output window shows the execution of another PL/SQL block, resulting in the message "PL/SQL procedure successfully completed.". Below it is a green bar labeled "EMP_SALARY" with the value "24000". A purple circle with the number "3" is to the right of the window.

2-30

Copyright © 2004, Oracle. All rights reserved.

ORACLE®

Substitution Variables (continued)

1. When you execute the block on the previous slide, *iSQL*Plus* prompts you to enter a value for `empno`, which is the substitution variable. By default the prompt message is “Enter value for <*substitution variable*>.” Enter a value as shown in the slide and click the Continue button.
2. You see the output shown in the slide. Note that *iSQL*Plus* prints both the old value and the new value for the substitution variable. You can set this off using the `SET VERIFY OFF` command.
3. The output after using `SET VERIFY OFF` command.

Prompt for Substitution Variables

```
SET VERIFY OFF
VARIABLE emp_salary NUMBER
ACCEPT empno PROMPT 'Please enter a valid employee
number: '
SET AUTOPRINT ON
DECLARE
    empno NUMBER(6):= &empno;
BEGIN
    SELECT salary INTO :emp_salary FROM employees
    WHERE employee_id = empno;
END;
/
```

 Input Required

Please enter a valid employee number:

ORACLE®

2-31

Copyright © 2004, Oracle. All rights reserved.

Prompt for Substitution Variables

In the previous slide, you have seen that the default prompt message is “Enter value for <substitution variable>.” Use the PROMPT command to change the message as shown in the slide. This is an iSQL*Plus command and therefore cannot be included in the PL/SQL block.

Using DEFINE for User Variable

Example:

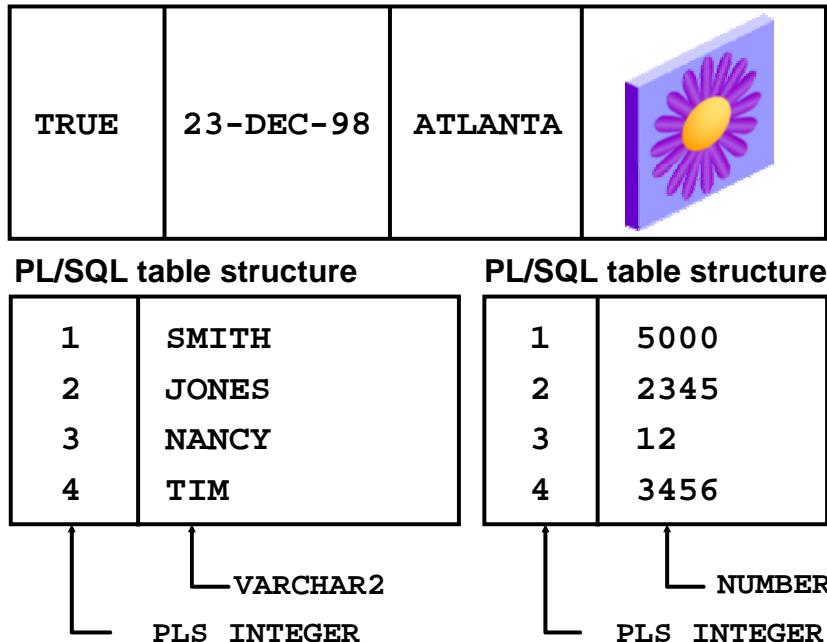

```
SET VERIFY OFF
DEFINE lname= Urman
DECLARE
    fname VARCHAR2(25);
BEGIN
    SELECT first_name INTO fname FROM employees
    WHERE last_name='&lname';
END;
/
```

Using DEFINE for User Variable

The DEFINE command specifies a user variable and assigns it a CHAR value. You can define variables of CHAR data type only. Even though you enter the number 50000, iSQL*Plus assigns a CHAR value to a variable consisting of the characters, 5,0,0,0 and 0. You can reference such variables with a preceding ampersand “&” as shown in the slide.

Composite Data Types

ORACLE®

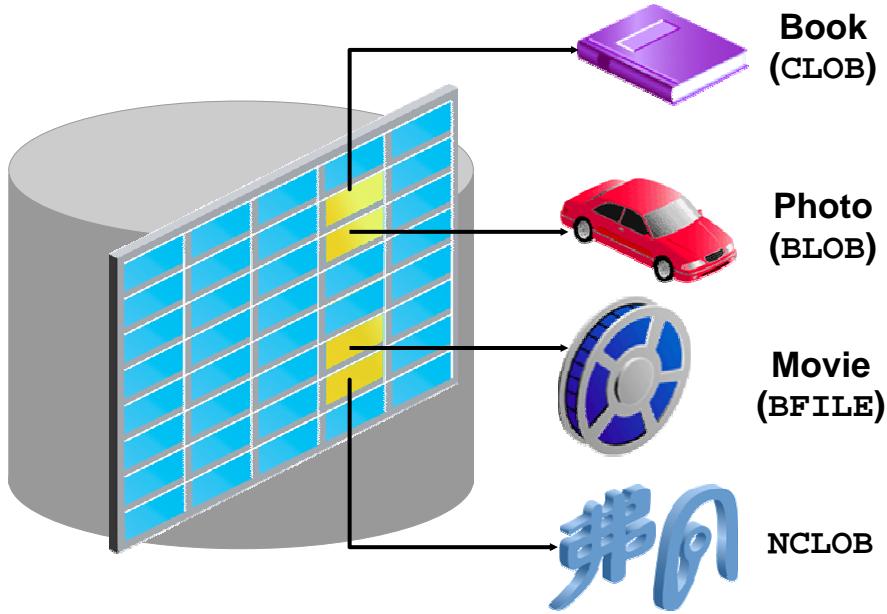

2-33

Copyright © 2004, Oracle. All rights reserved.

Composite Data Types

A scalar type has no internal components. A composite type has internal components that can be manipulated individually. Composite data types (also known as collections) are of TABLE, RECORD, NESTED TABLE, and VARRAY types. Use the RECORD data type to treat related but dissimilar data as a logical unit. Use the TABLE data type to reference and manipulate collections of data as a whole object. NESTED TABLE and VARRAY data types are covered in the *Oracle Database 10g: Develop PL/SQL Program Units* course.

LOB Data Type Variables

2-34

Copyright © 2004, Oracle. All rights reserved.

ORACLE®

LOB Data Type Variables

Large objects (LOBs) are meant to store a large amount of data. A database column can be of the LOB category. With the LOB category of data types (BLOB, CLOB, and so on) you can store blocks of unstructured data (such as text, graphic images, video clips, and sound wave forms) up to 4 gigabytes in size. LOB data types allow efficient, random, piecewise access to the data and can be attributes of an object type.

- The character large object (CLOB) data type is used to store large blocks of character data in the database.
- The binary large object (BLOB) data type is used to store large unstructured or structured binary objects in the database. When you insert or retrieve such data to and from the database, the database does not interpret the data. External applications that use this data must interpret the data.
- The binary file (BFILE) data type is used to store large binary files. Unlike other LOBS, BFILES are not stored in the database. BFILES are stored outside the database. They could be operating system files. Only a pointer to the BFILE is stored in the database.
- The national language character large object (NCLOB) data type is used to store large blocks of single-byte or fixed-width multibyte NCHAR unicode data in the database.

Summary

In this lesson, you should have learned how to:

- **Identify valid and invalid identifiers**
- **Declare variables in the declarative section of a PL/SQL block**
- **Initialize variables and utilize them in the executable section**
- **Differentiate between scalar and composite data types**
- **Use the %TYPE attribute**
- **Make use of bind variables**

ORACLE®

2-35

Copyright © 2004, Oracle. All rights reserved.

Summary

An anonymous PL/SQL block is a basic, unnamed unit of a PL/SQL program. It consists of a set of SQL or PL/SQL statements to perform a logical function. The declarative part is the first part of a PL/SQL block and is used for declaring objects such as variables, constants, cursors, and definitions of error situations called exceptions. In this lesson, you have learned how to declare variables in the declarative section. You have seen some of the guidelines for declaring variables. You have learned how to initialize variables when you declare them. The executable part is the mandatory part of a PL/SQL block, and contains SQL and PL/SQL statements for querying and manipulating data. In this lesson, you have learned how to initialize variables in the executable section and also how to utilize them and manipulate the values of variables.

Practice 2: Overview

This practice covers the following topics:

- Determining valid identifiers
- Determining valid variable declarations
- Declaring variables within an anonymous block
- Using the %TYPE attribute to declare variables
- Declaring and printing a bind variable
- Executing a PL/SQL block

ORACLE®

2-36

Copyright © 2004, Oracle. All rights reserved.

Practice 2: Overview

This practice helps you revisit some of the topics you have learned in this lesson. You will identify valid and invalid identifiers. You will declare variables and also use the %TYPE attribute to declare variables.

Paper-Based Questions

Questions 1, 2, and 3 are paper-based questions.

Practice 2

1. Identify valid and invalid identifier names:
 - a. today
 - b. last_name
 - c. today's_date
 - d. Number_of_days_in_February_this_year
 - e. Isleap\$year
 - f. #number
 - g. NUMBER#
 - h. number1to7
2. Identify valid and invalid variable declaration and initialization:
 - a. number_of_copies PLS_INTEGER;
 - b. printer_name constant VARCHAR2(10);
 - c. deliver_to VARCHAR2(10):=Johnson;
 - d. by_when DATE:= SYSDATE+1;
3. Examine the following anonymous block and choose the appropriate statement.

```
SET SERVEROUTPUT ON
DECLARE
    fname VARCHAR2(20);
    lname VARCHAR2(15) DEFAULT 'fernandez';
BEGIN
    DBMS_OUTPUT.PUT_LINE( FNAME || ' ' || lname);
END;
/
```

 - a. The block will execute successfully and print ‘fernandez’
 - b. The block will give an error because the fname variable is used without initializing.
 - c. The block will execute successfully and print ‘null fernandez’
 - d. The block will give an error because you cannot use the DEFAULT keyword to initialize a variable of type VARCHAR2.
 - e. The block will give an error because the variable FNAME is not declared.
4. Create an anonymous block. In iSQL*Plus, load the script lab_01_02_soln.sql, which you created in question 2 of practice 1.
 - a. Add a declarative section to this PL/SQL block. In the declarative section declare the following variables:
 1. Variable today of type DATE. Initialize today with SYSDATE.
 2. Variable tomorrow of type today. Use %TYPE attribute to declare this variable.
 - b. In the executable section initialize the variable tomorrow with an expression which calculates tomorrow’s date (add one to the value in today). Print the value of today and tomorrow after printing ‘Hello World’

Practice 2 (continued)

- c. Execute and save this script as lab_02_04_soln.sql. Sample output is shown below.

Hello World
TODAY IS : 12-JAN-04
TOMORROW IS : 13-JAN-04
PL/SQL procedure successfully completed.

5. Edit the lab_02_04_soln.sql script.

- a. Add code to create two bind variables.

Create bind variables basic_percent and pf_percent of type NUMBER.

- b. In the executable section of the PL/SQL block assign the values 45 and 12 to basic_percent and pf_percent respectively.
- c. Terminate the PL/SQL block with “/” and display the value of the bind variables by using the PRINT command.
- d. Execute and save your script file as lab_02_05_soln.sql. Sample output is shown below.

Hello World
TODAY IS : 12-JAN-04
TOMORROW IS : 13-JAN-04
PL/SQL procedure successfully completed.

Writing Executable Statements

3

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- **Identify lexical units in a PL/SQL block**
- **Use built-in SQL functions in PL/SQL**
- **Describe when implicit conversions take place and when explicit conversions have to be dealt with**
- **Write nested blocks and qualify variables with labels**
- **Write readable code with appropriate indentations**

ORACLE®

3-2

Copyright © 2004, Oracle. All rights reserved.

Lesson Aim

You have learned how to declare variables and write executable statements in a PL/SQL block. In this lesson you learn how lexical units make up a PL/SQL block. You learn to write nested blocks. You also learn about the scope and visibility of variables in the nested blocks and to qualify them with labels.

Lexical Units in a PL/SQL Block

Lexical units:

- Are building blocks of any PL/SQL block
- Are sequences of characters including letters, digits, tabs, spaces, returns, and symbols
- Can be classified as:
 - Identifiers
 - Delimiters
 - Literals
 - Comments

ORACLE®

3-3

Copyright © 2004, Oracle. All rights reserved.

Lexical Units in a PL/SQL Block

Lexical units include letters, digits, special characters, tabs, spaces, returns, and symbols.

- **Identifiers:** Identifiers are the names given to PL/SQL objects. You have learned to identify valid and invalid identifiers. Recollect that keywords cannot be used as identifiers.

Quoted Identifiers: Quoted identifiers are used to:

- Make identifiers case sensitive
- Include characters such as spaces
- Use reserved words

Examples:

```
"begin date" DATE;  
"end date"    DATE;  
"exception thrown" BOOLEAN DEFAULT TRUE;
```

All the subsequent usage of these variables should have double quotes.

- **Delimiters:** Delimiters are symbols that have special meaning. You have already learned that the symbol “;” is used to terminate a SQL or PL/SQL statement. Therefore, “;” is the best example of a delimiter.

For more information please refer to “*PL/SQL User’s Guide and Reference*.”

Lexical Units in a PL/SQL Block (continued)

- **Delimiters (continued)**

Delimiters are simple or compound symbols that have special meaning to PL/SQL.
Simple Symbols

Symbol	Meaning
+	Addition operator
-	Subtraction/negation operator
*	Multiplication operator
/	Division operator
=	Equality operator
@	Remote access indicator
;	Statement terminator

Compound Symbols

Symbol	Meaning
<>	Relational operator
!=	Relational operator
	Concatenation operator
--	Single line comment indicator
/*	Beginning comment delimiter
*/	Ending comment delimiter
:=	Assignment operator

Note: This is only a subset and not a complete list of delimiters.

- **Literals:** Any value that is assigned to a variable is a literal. Any character, number, Boolean, or date value that is not an identifier is a literal. Literals are classified as:
 - Character literals: All string literals have the data type CHAR and therefore called a character literal. Example, ‘John’, ‘12C’, ‘1234’, and ‘12-JAN-1923’.
 - Numeric literals: Numeric literal represents an integer or real value. Examples, 428 and 1.276.
 - Boolean literals: Values that are assigned to Boolean variables are Boolean literals. TRUE, FALSE, and NULL are Boolean literals or keywords.
- **Comments:** It is a good programming practice to explain what a piece of code is trying to achieve. When you include the explanation in a PL/SQL block, the compiler cannot interpret these instructions. There should be a way in which you can indicate that these instructions need not be compiled. Comments are mainly used for this purpose. Any instruction that is commented is not interpreted by the compiler.
 - Two dashes ‘--’ are used for commenting a single line.
 - ‘/* */’ is used for commenting multiple lines.

PL/SQL Block Syntax and Guidelines

- **Literals:**
 - Character and date literals must be enclosed in single quotation marks.

```
name := 'Henderson';
```
 - Numbers can be simple values or scientific notation.
- **Statements can continue over several lines.**

ORACLE®

3-5

Copyright © 2004, Oracle. All rights reserved.

PL/SQL Block Syntax and Guidelines

A literal is an explicit numeric, character string, date, or Boolean value that is not represented by an identifier.

- Character literals include all the printable characters in the PL/SQL character set: letters, numerals, spaces, and special symbols.
- Numeric literals can be represented either by a simple value (for example, -32.5) or by a scientific notation (for example, 2E5, meaning 2×10^5 = 200000).

Commenting Code

- Prefix single-line comments with two dashes (--) .
- Place multiple-line comments between the symbols “/*” and “*/”.

Example:

```
DECLARE
  ...
  annual_sal NUMBER (9,2);
BEGIN      -- Begin the executable section

  /* Compute the annual salary based on the
     monthly salary input from the user */
  annual_sal := monthly_sal * 12;
END;        -- This is the end of the block
/
```

ORACLE®

Commenting Code

Comment code to document each phase and to assist debugging. Comment the PL/SQL code with two dashes (--) if the comment is on a single line, or enclose the comment between the symbols “/*” and “*/” if the comment spans several lines. Comments are strictly informational and do not enforce any conditions or behavior on logic or data. Well-placed comments are extremely valuable for code readability and future code maintenance. In the example in the slide, the lines enclosed within “/*” and “*/” is a comment that explains the code that follows it.

SQL Functions in PL/SQL

- **Available in procedural statements:**
 - Single-row number
 - Single-row character
 - Data type conversion
 - Date
 - Timestamp
 - GREATEST and LEAST
 - Miscellaneous functions
- **Not available in procedural statements:**
 - DECODE
 - Group functions

ORACLE®

3-7

Copyright © 2004, Oracle. All rights reserved.

SQL Functions in PL/SQL

SQL provides a number of predefined functions that can be used in SQL statements. Most of these functions are valid in PL/SQL expressions. These SQL functions are categorized as follows:

- Single-row number functions
- Single-row character functions
- Data type conversion functions
- Date functions
- Timestamp functions
- GREATEST, LEAST
- Miscellaneous functions

The following functions are not available in procedural statements:

- DECODE
- Group functions: AVG, MIN, MAX, COUNT, SUM, STDDEV, and VARIANCE. Group functions apply to groups of rows in a table and therefore are available only in SQL statements in a PL/SQL block.

The methods mentioned here are only a subset of the complete list.

SQL Functions in PL/SQL: Examples

- Get the length of a string:

```
desc_size INTEGER(5);
prod_description VARCHAR2(70):='You can use this
product with your radios for higher frequency';

-- get the length of the string in prod_description
desc_size:= LENGTH(prod_description);
```

- Convert the employee name to lowercase:

```
emp_name:= LOWER(emp_name);
```

SQL Functions in PL/SQL: Examples

SQL functions help you to manipulate data; they fall into the following categories:

- Number
- Character
- Conversion
- Date
- Miscellaneous

Data Type Conversion

- Convert data to comparable data types
- Are of two types:
 - Implicit conversions
 - Explicit conversions

Some conversion functions:

- TO_CHAR
- TO_DATE
- TO_NUMBER
- TO_TIMESTAMP

ORACLE®

3-9

Copyright © 2004, Oracle. All rights reserved.

Data Type Conversion

In any programming language, converting one data type to another is a common requirement. PL/SQL can handle such conversions with scalar data types. Data type conversions can be of two types:

Implicit conversions: PL/SQL attempts to convert data types dynamically if they are mixed in a statement. Consider the following example:

```
DECLARE
    salary NUMBER(6):=6000;
    sal_hike VARCHAR2(5):='1000';
    total_salary salary%TYPE;
BEGIN
    total_salary:=salary+sal_hike;
END;
/
```

In the example shown, the variable `sal_hike` is of type `VARCHAR2`. While calculating the total salary, PL/SQL will first convert `sal_hike` to `NUMBER` and then perform the operation. The result of the operation will then be of the `NUMBER` type. Implicit conversions can happen between:

- Characters and numbers
- Characters and dates

Data Type Conversion (continued)

- **Explicit conversions:** To convert values from one data type to another, use built-in functions. For example, to convert a CHAR value to a DATE or NUMBER value, use the function TO_DATE or TO_NUMBER respectively.

Data Type Conversion

1

```
date_of_joining DATE:= '02-Feb-2000';
```

2

```
date_of_joining DATE:= 'February 02,2000';
```

3

```
date_of_joining DATE:= TO_DATE('February  
02,2000','Month DD, YYYY');
```

ORACLE®

3-11

Copyright © 2004, Oracle. All rights reserved.

Data Type Conversion (continued)

The examples in the slide show implicit and explicit conversions of the DATE data type.

1. Implicit conversion happens in this case and the date is assigned to `date_of_joining`.
2. PL/SQL gives you an error because the date that is being assigned is not in the default format.
3. Use the `TO_DATE` function to explicitly convert the given date in a particular format and assign it to the DATE data type variable `date_of_joining`.

Nested Blocks

PL/SQL blocks can be nested.

- **An executable section (`BEGIN` ... `END`) can contain nested blocks.**
- **An exception section can contain nested blocks.**

Nested Blocks

One of the advantages that PL/SQL has over SQL is the ability to nest statements. You can nest blocks wherever an executable statement is allowed, thus making the nested block a statement. If your executable section has code for many logically related functionalities to support multiple business requirements, you can break down the executable section into smaller blocks. The exception section can also contain nested blocks.

Nested Blocks

Example:

```
DECLARE
    outer_variable VARCHAR2(20):='GLOBAL VARIABLE';
BEGIN
    DECLARE
        inner_variable VARCHAR2(20):='LOCAL VARIABLE';
    BEGIN
        DBMS_OUTPUT.PUT_LINE(inner_variable);
        DBMS_OUTPUT.PUT_LINE(outer_variable);
    END;
    DBMS_OUTPUT.PUT_LINE(outer_variable);
END;
/
```

ORACLE®

3-13

Copyright © 2004, Oracle. All rights reserved.

Nested Blocks (continued)

The example shown in the slide has an outer (parent) block and a nested (child) block. The variable `outer_variable` is declared in the outer block and the variable `inner_variable` is declared in the inner block.

`outer_variable` is local to the outer block but global to the inner block. When you access this variable in the inner block, PL/SQL first looks for a local variable in the inner block with that name. We do not have any variable with the same name in the inner block and therefore PL/SQL will look for the variable in the outer block. Therefore, `outer_variable` is considered the global variable for all the enclosing blocks. You can access this variable in the inner block as shown in the slide. Variables declared in a PL/SQL block are considered local to that block and global to all its subblocks.

The `inner_variable` variable is local to the inner block and is not global because the inner block does not have any nested blocks. This variable can be accessed only within the inner block. If PL/SQL does not find the variable declared locally, it looks upward in the declarative section of the parent blocks. PL/SQL does not look downward in the child blocks.

Variable Scope and Visibility

```
DECLARE
    father_name VARCHAR2(20):='Patrick';
    date_of_birth DATE:='20-Apr-1972';
BEGIN
    DECLARE
        child_name VARCHAR2(20):='Mike';
        date_of_birth DATE:='12-Dec-2002';
    BEGIN
        1   DBMS_OUTPUT.PUT_LINE('Father''s Name: '||father_name);
        DBMS_OUTPUT.PUT_LINE('Date of Birth: '||date_of_birth);
        DBMS_OUTPUT.PUT_LINE('Child''s Name: '||child_name);
    END;
    2   DBMS_OUTPUT.PUT_LINE('Date of Birth: '||date_of_birth);
END;
/
```

ORACLE

3-14

Copyright © 2004, Oracle. All rights reserved.

Variable Scope and Visibility

The output of the block shown in the slide is as follows:

Father's Name: Patrick
Date of Birth: 12-DEC-02
Child's Name: Mike
Date of Birth: 20-APR-72
PL/SQL procedure successfully completed.

Examine the date of birth that is printed for father and child.

The **scope** of a variable is the portion of the program in which the variable is declared and is accessible.

The **visibility** of a variable is the portion of the program where the variable can be accessed without using a qualifier.

Scope

- The variables `father_name` and `date_of_birth` are declared in the outer block. These variables will have the scope of the block in which they are declared and accessible. Therefore, the scope of these variables are limited to the outer block.

Variable Scope and Visibility (continued)

Scope (continued)

- The variables `child_name` and `date_of_birth` are declared in the inner block or the nested block. These variables are accessible only within the nested block and are not accessible in the outer block. When a variable is out of scope, PL/SQL frees the memory used to store the variable and therefore these variables cannot be referenced.

Visibility

- The `date_of_birth` variable declared in the outer block has the scope even in the inner block. However, this variable is not visible in the inner block because the inner block has a local variable with the same name.
 1. Observe the code in the executable section of the PL/SQL block. You can print the father's name, the child's name, and the date of birth. Only the child's date of birth can be printed here because the father's date of birth is not visible here.
 2. Father's date of birth is visible here and therefore can be printed.

You cannot have variables with same name in a block. However, you can declare variables with same name in two different blocks (nested blocks). The two items represented by the identifiers are distinct, and any change in one does not affect the other.

Qualify an Identifier

```
<<outer>>
DECLARE
    father_name VARCHAR2(20):='Patrick';
    date_of_birth DATE:='20-Apr-1972';
BEGIN
    DECLARE
        child_name VARCHAR2(20):='Mike';
        date_of_birth DATE:='12-Dec-2002';
    BEGIN
        DBMS_OUTPUT.PUT_LINE('Father''s Name: '||father_name);
        DBMS_OUTPUT.PUT_LINE('Date of Birth: '
                             ||outer.date_of_birth);
        DBMS_OUTPUT.PUT_LINE('Child''s Name: '||child_name);
        DBMS_OUTPUT.PUT_LINE('Date of Birth: '||date_of_birth);
    END;
END;
/`
```

ORACLE

3-16

Copyright © 2004, Oracle. All rights reserved.

Qualify an Identifier

Qualifier is a label given to a block. You can use this qualifier to access the variables which have scope but are not visible. Observe the code: you can now print father's date of birth and child's date of birth in the inner block. The outer block is labeled `outer`. You can use this label to access the variable `date_of_birth` declared in the outer block.

Labeling is not limited to the outer block, you can label any block. The output of the code in the slide is shown below.

Father's Name: Patrick
Date of Birth: 20-APR-72
Child's Name: Mike
Date of Birth: 12-DEC-02
PL/SQL procedure successfully completed.

Determining Variable Scope

```
<<outer>>
DECLARE
    sal      NUMBER(7,2) := 60000;
    comm     NUMBER(7,2) := sal * 0.20;
    message  VARCHAR2(255) := ' eligible for commission';
BEGIN
    DECLARE
        sal          NUMBER(7,2) := 50000;
        comm         NUMBER(7,2) := 0;
        total_comp   NUMBER(7,2) := sal + comm;
    BEGIN
        message := 'CLERK not'||message;
        outer.comm := sal * 0.30;
    END;
    message := 'SALESMAN' || message;
END;
/
```

- 1
- 2

Determining Variable Scope

Evaluate the PL/SQL block in the slide. Determine each of the following values according to the rules of scoping:

1. The value of MESSAGE at position 1.
2. The value of TOTAL_COMP at position 2.
3. The value of COMM at position 1.
4. The value of outer.COMM at position 1.
5. The value of COMM at position 2.
6. The value of MESSAGE at position 2.

Operators in PL/SQL

- Logical
 - Arithmetic
 - Concatenation
 - Parentheses to control order of operations
 - Exponential operator (**)
- } Same as in SQL

ORACLE®

3-18

Copyright © 2004, Oracle. All rights reserved.

Operators in PL/SQL

The operations within an expression are performed in a particular order depending on their precedence (priority). The following table shows the default order of operations from high priority to low priority:

Operator	Operation
**	Exponentiation
+ , -	Identity, negation
* , /	Multiplication, division
+ , - ,	Addition, subtraction, concatenation
=, <, >, <=, >=, <>, !=, ~=, ^=, IS NULL, LIKE, BETWEEN, IN	Comparison
NOT	Logical negation
AND	Conjunction
OR	Inclusion

Operators in PL/SQL

Examples:

- Increment the counter for a loop.

```
loop_count := loop_count + 1;
```

- Set the value of a Boolean flag.

```
good_sal := sal BETWEEN 50000 AND 150000;
```

- Validate whether an employee number contains a value.

```
valid := (empno IS NOT NULL);
```

ORACLE®

3-19

Copyright © 2004, Oracle. All rights reserved.

Operators in PL/SQL (continued)

When working with nulls, you can avoid some common mistakes by keeping in mind the following rules:

- Comparisons involving nulls always yield NULL.
- Applying the logical operator NOT to a null yields NULL.
- In conditional control statements, if the condition yields NULL, its associated sequence of statements is not executed.

Programming Guidelines

Make code maintenance easier by:

- **Documenting code with comments**
- **Developing a case convention for the code**
- **Developing naming conventions for identifiers and other objects**
- **Enhancing readability by indenting**

Programming Guidelines

Follow programming guidelines shown in the slide to produce clear code and reduce maintenance when developing a PL/SQL block.

Code Conventions

The following table provides guidelines for writing code in uppercase or lowercase to help you distinguish keywords from named objects.

Category	Case Convention	Examples
SQL statements	Uppercase	SELECT, INSERT
PL/SQL keywords	Uppercase	DECLARE, BEGIN, IF
Data types	Uppercase	VARCHAR2, BOOLEAN
Identifiers and parameters	Lowercase	v_sal, emp_cursor, g_sal, p_empno
Database tables and columns	Lowercase	employees, employee_id, department_id

Indenting Code

For clarity, indent each level of code.

Example:

```
BEGIN
    IF x=0 THEN
        y:=1;
    END IF;
END;
/
```

```
DECLARE
    deptno      NUMBER(4);
    location_id NUMBER(4);
BEGIN
    SELECT department_id,
           location_id
    INTO   deptno,
           location_id
    FROM   departments
    WHERE  department_name
           = 'Sales';
...
END;
/
```

ORACLE

3-21

Copyright © 2004, Oracle. All rights reserved.

Indenting Code

For clarity, and to enhance readability, indent each level of code. To show structure, you can divide lines using carriage returns and indent lines using spaces or tabs. Compare the following IF statements for readability:

```
IF x>y THEN max:=x;ELSE max:=y;END IF;
```

```
IF x > y THEN
    max := x;
ELSE
    max := y;
END IF;
```

Summary

In this lesson, you should have learned how to:

- **Use built-in SQL functions in PL/SQL**
- **Write nested blocks to break logically related functionalities**
- **Decide when you should perform explicit conversions**
- **Qualify variables in nested blocks**

Summary

Because PL/SQL is an extension of SQL, the general syntax rules that apply to SQL also apply to the PL/SQL language.

A block can have any number of nested blocks defined within its executable part. Blocks defined within a block are called subblocks. You can nest blocks only in the executable part of a block. Because the exception section is also in the executable section, you can have nested blocks in that section. Ensure correct scope and visibility of the variables when you have nested blocks. Avoid using the same identifiers in the parent and child blocks.

Most of the functions available in SQL are also valid in PL/SQL expressions. Conversion functions convert a value from one data type to another. Comparison operators compare one expression to another. The result is always TRUE, FALSE, or NULL. Typically, you use comparison operators in conditional control statements and in the WHERE clause of SQL data manipulation statements. The relational operators allow you to compare arbitrarily complex expressions.

Practice 3 Overview

This practice covers the following topics:

- Reviewing scoping and nesting rules
- Writing and testing PL/SQL blocks

Practice 3 Overview

This practice reinforces the basics of PL/SQL that were presented in the lesson. The practices use sample PL/SQL blocks and test the understanding of the rules of scoping. Students also write and test PL/SQL blocks.

Paper-Based Questions

Questions 1 and 2 are paper-based questions.

Practice 3

PL/SQL Block

```
DECLARE
    weight      NUMBER(3) := 600;
    message     VARCHAR2(255) := 'Product 10012';
BEGIN
    DECLARE
        weight      NUMBER(3) := 1;
        message     VARCHAR2(255) := 'Product 11001';
        new_locn   VARCHAR2(50) := 'Europe';
    BEGIN
        weight := weight + 1;
        new_locn := 'Western' || new_locn;
    
```

1 →

```
        END;
        weight := weight + 1;
        message := message || ' is in stock';
        new_locn := 'Western' || new_locn;
    
```

2 →

```
    END;
    /

```

1. Evaluate the PL/SQL block given above and determine the data type and value of each of the following variables according to the rules of scoping.
 - a. The value of `weight` at position 1 is:
 - b. The value of `new_locn` at position 1 is:
 - c. The value of `weight` at position 2 is:
 - d. The value of `message` at position 2 is:
 - e. The value of `new_locn` at position 2 is:

Practice 3 (continued)

Scope Example

```
DECLARE
    customer          VARCHAR2( 50 ) := 'Womansport';
    credit_rating     VARCHAR2(50)  := 'EXCELLENT';
BEGIN
    DECLARE
        customer      NUMBER( 7 ) := 201;
        name         VARCHAR2(25) := 'Unisports';
    BEGIN
        credit_rating := 'GOOD';
        ...
    END;
    ...
END;
/
```

2. In the PL/SQL block shown above, determine the values and data types for each of the following cases.
 - a. The value of `customer` in the nested block is:
 - b. The value of `name` in the nested block is:
 - c. The value of `credit_rating` in the nested block is:
 - d. The value of `customer` in the main block is:
 - e. The value of `name` in the main block is:
 - f. The value of `credit_rating` in the main block is:

Practice 3 (continued)

3. Use the same session that you used to execute the practices in Lesson 2. If you have opened a new session, then execute `lab_02_05_soln.sql`. Edit `lab_02_05_soln.sql`.
 - a. Use single line comment syntax to comment the lines that create the bind variables.
 - b. Use multiple line comments in the executable section to comment the lines that assign values to the bind variables.
 - c. Declare two variables: `fname` of type `VARCHAR2` and size 15, and `emp_sal` of type `NUMBER` and size 10.
 - d. Include the following SQL statement in the executable section:

```
SELECT first_name, salary
      INTO fname, emp_sal FROM employees
        WHERE employee_id=110;
```
 - e. Change the line that prints ‘Hello World’ to print ‘Hello’ and the first name. You can comment the lines that display the dates and print the bind variables, if you want to.
 - f. Calculate the contribution of the employee towards provident fund (PF). PF is 12% of the basic salary and basic salary is 45% of the salary. Use the bind variables for the calculation. Try and use only one expression to calculate the PF. Print the employee’s salary and his contribution towards PF.
 - g. Execute and save your script as `lab_03_03_soln.sql`. Sample output is shown below.

```
Hello John
YOUR SALARY IS : 8200
YOUR CONTRIBUTION TOWARDS PF: 442.8
PL/SQL procedure successfully completed.
```

4. Accept a value at run time using the substitution variable. In this practice, you will modify the script that you created in exercise 3 to accept user input.
 - a. Load the script `lab_03_04.sql` file.
 - b. Include the `PROMPT` command to prompt the user with the following message: ‘Please enter your employee number.’
 - c. Modify the declaration of the `empno` variable to accept the user input.
 - d. Modify the select statement to include the variable `empno`.
 - e. Execute and save your script as `lab_03_04_soln.sql`. Sample output is shown below.

Practice 3 (continued)

 **Input Required**

Cancel **Continue**

Please enter your employee number:

Enter 100 and click the Continue button.

Hello Steven
YOUR SALARY IS : 24000
YOUR CONTRIBUTION TOWARDS PF: 1296
PL/SQL procedure successfully completed.

5. Execute the script `lab_03_05.sql`. This script creates a table called `employee_details`.
 - a. The `employee` and `employee_details` tables have the same data. You will update the data in the `employee_details` table. Do not update or change the data in the `employees` table.
 - b. Open the script `lab_03_05b.sql` and observe the code in the file. Note that the code accepts the employee number and the department number from the user.
 - c. You will use this as the skeleton script to develop the application, which was discussed in the lesson titled “Introduction.”

4

Interacting with the Oracle Server

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- Decide which SQL statements can be directly included in a PL/SQL executable block
- Manipulate data with DML statements in PL/SQL
- Use transaction control statements in PL/SQL
- Make use of the INTO clause to hold the values returned by a SQL statement
- Differentiate between implicit cursors and explicit cursors
- Use SQL cursor attributes

ORACLE®

4-2

Copyright © 2004, Oracle. All rights reserved.

Lesson Aim

In this lesson, you learn to embed standard SQL SELECT, INSERT, UPDATE, DELETE, and MERGE statements in PL/SQL blocks. You learn how to include data definition language (DDL) and also transaction control statements in PL/SQL. You will understand the need for cursors and differentiate between the two types of cursors. The lesson also familiarizes you with the various SQL cursor attributes that can be used with implicit cursors.

SQL Statements in PL/SQL

- **Retrieve a row from the database by using the SELECT command.**
- **Make changes to rows in the database by using DML commands.**
- **Control a transaction with the COMMIT, ROLLBACK, or SAVEPOINT command.**

ORACLE®

4-3

Copyright © 2004, Oracle. All rights reserved.

SQL Statements in PL/SQL

In a PL/SQL block you make use of SQL statements to retrieve and modify data from the database table. PL/SQL supports data manipulation language (DML) and transaction control commands. You can use DML commands to modify the data in a database table. However, remember the following points while using DML statements and transaction control commands in PL/SQL blocks:

- The keyword END signals the end of a PL/SQL block, not the end of a transaction. Just as a block can span multiple transactions, a transaction can span multiple blocks.
- PL/SQL does not directly support data definition language (DDL) statements, such as CREATE TABLE, ALTER TABLE, or DROP TABLE. PL/SQL supports early binding due to which the compilation time is greater than the execution time. If applications have to create database objects at run time by passing values, then early binding cannot happen in such cases. DDL statements cannot be directly executed. These statements are dynamic SQL statements. Dynamic SQL statements are built as character strings at run time and can contain placeholders for parameters. Therefore, you can use dynamic SQL to execute your DDL statements in PL/SQL. Use EXECUTE IMMEDIATE statement which takes the SQL statement as an argument to execute your DDL statement. The EXECUTE IMMEDIATE statement parses and executes a dynamic SQL statement.

SQL Statements in PL/SQL (continued)

Consider the following example:

```
BEGIN  
    CREATE TABLE My_emp_table AS SELECT * FROM employees;  
END;  
/
```

The example uses a DDL statement directly in the block. When you execute the block, you will see the following error:

```
create table My_table as select * from table_name; *  
ERROR at line 5:  
ORA-06550: line 5, column 1:  
PLS-00103: Encountered the symbol "CREATE" when  
expecting one of the following:  
...  
...
```

Use the EXECUTE IMMEDIATE statement to avoid the error:

```
BEGIN  
    EXECUTE IMMEDIATE 'CREATE TABLE My_emp_table AS  
    SELECT * FROM employees';  
END;  
/
```

- PL/SQL does not support data control language (DCL) statements, such as GRANT or REVOKE. You can use EXECUTE IMMEDIATE statement to execute them.
- You use transaction control statements to make the changes to the database permanent or to discard them. COMMIT, ROLLBACK, and SAVEPOINT are three main transactional control statements that are used. COMMIT is used to make the database changes permanent. ROLLBACK is for discarding any changes that were made to the database after the last COMMIT. SAVEPOINT is used to mark an intermediate point in transaction processing. The transaction control commands are valid in PL/SQL and therefore can be directly used in the executable section of a PL/SQL block.

SELECT Statements in PL/SQL

Retrieve data from the database with a SELECT statement.

Syntax:

```
SELECT  select_list
        INTO   {variable_name[, variable_name]...
               | record_name}
        FROM   table
        [WHERE  condition];
```

ORACLE®

4-5

Copyright © 2004, Oracle. All rights reserved.

SELECT Statements in PL/SQL

Use the SELECT statement to retrieve data from the database. In the syntax:

<i>select_list</i>	Is a list of at least one column and can include SQL expressions, row functions, or group functions
<i>variable_name</i>	Is the scalar variable that holds the retrieved value
<i>record_name</i>	Is the PL/SQL RECORD that holds the retrieved values
<i>table</i>	Specifies the database table name
<i>condition</i>	Is composed of column names, expressions, constants, and comparison operators, including PL/SQL variables and constants

Guidelines for Retrieving Data in PL/SQL

- Terminate each SQL statement with a semicolon (;).
- Every value retrieved must be stored in a variable using the INTO clause.
- The WHERE clause is optional and can be used to specify input variables, constants, literals, or PL/SQL expressions. However, when you use the INTO clause, you should fetch only one row and the usage of WHERE clause is a must in such cases.

SELECT Statements in PL/SQL (continued)

- Specify the same number of variables in the INTO clause as database columns in the SELECT clause. Be sure that they correspond positionally and that their data types are compatible.
- Use group functions, such as SUM, in a SQL statement, because group functions apply to groups of rows in a table.

SELECT Statements in PL/SQL

- **The INTO clause is required.**
- **Queries must return only one row.**

Example:

```
SET SERVEROUTPUT ON
DECLARE
  fname VARCHAR2(25);
BEGIN
  SELECT first_name INTO fname
  FROM employees WHERE employee_id=200;
  DBMS_OUTPUT.PUT_LINE(' First Name is : '||fname);
END;
/
```

SELECT Statements in PL/SQL (continued)

INTO Clause

The INTO clause is mandatory and occurs between the SELECT and FROM clauses. It is used to specify the names of variables that hold the values that SQL returns from the SELECT clause. You must specify one variable for each item selected, and the order of the variables must correspond with the items selected.

Use the INTO clause to populate either PL/SQL variables or host variables.

Queries Must Return Only One Row

SELECT statements within a PL/SQL block fall into the ANSI classification of embedded SQL, for which the following rule applies: queries must return only one row. A query that returns more than one row or no row generates an error.

PL/SQL manages these errors by raising standard exceptions, which you can handle in the exception section of the block with the NO_DATA_FOUND and TOO_MANY_ROWS exceptions. Include a WHERE condition in the SQL statement such that the statement returns a single row. You will learn about exception handling later in the course.

SELECT Statements in PL/SQL (continued)

How to Retrieve Multiple Rows from a Table and Operate on the Data

A SELECT statement with the INTO clause can retrieve only one row at a time. If your requirement is to retrieve multiple rows and operate on the data, then you can make use of explicit cursors. You will learn about cursors later in this lesson.

Retrieving Data in PL/SQL

Retrieve the hire_date and the salary for the specified employee.

Example:

```
DECLARE
    emp_hiredate    employees.hire_date%TYPE;
    emp_salary      employees.salary%TYPE;
BEGIN
    SELECT    hire_date, salary
    INTO      emp_hiredate, emp_salary
    FROM     employees
    WHERE    employee_id = 100;
END;
/
```

ORACLE®

4-9

Copyright © 2004, Oracle. All rights reserved.

Retrieving Data in PL/SQL

In the example in the slide, the variables emp_hiredate and emp_salary are declared in the declarative section of the PL/SQL block. In the executable section, the values of the columns hire_date and salary for the employee with the employee_id 100 is retrieved from the employees table and stored in the emp_hiredate and emp_salary variables, respectively. Observe how the INTO clause, along with the SELECT statement, retrieves the database column values into the PL/SQL variables.

Note: The SELECT statement is retrieving hire_date and then salary and therefore the variables in the INTO clause also must be in the same order. For example, if you interchange emp_hiredate and emp_salary in the above statement, the statement will result in an error.

Retrieving Data in PL/SQL

Return the sum of the salaries for all the employees in the specified department.

Example:

```
SET SERVEROUTPUT ON
DECLARE
    sum_sal  NUMBER(10,2);
    deptno   NUMBER NOT NULL := 60;
BEGIN
    SELECT  SUM(salary) -- group function
    INTO sum_sal FROM employees
    WHERE  department_id = deptno;
    DBMS_OUTPUT.PUT_LINE ('The sum of salary is '
    || sum_sal);
END;
/
```

ORACLE

4-10

Copyright © 2004, Oracle. All rights reserved.

Retrieving Data in PL/SQL (continued)

In the example in the slide, the `sum_sal` and `deptno` variables are declared in the declarative section of the PL/SQL block. In the executable section, the total salary for the employees in the department with the `department_id` 60 is computed using the SQL aggregate function `SUM`. The calculated total salary is assigned to the `sum_sal` variable.

Note: Group functions cannot be used in PL/SQL syntax. They are used in SQL statements within a PL/SQL block as shown in the example. You cannot use them as follows:

```
sum_sal := SUM(employees.salary);
```

The output of the PL/SQL block in the slide is shown below:

The sum of salary is 28800

PL/SQL procedure successfully completed.

Naming Conventions

```
DECLARE
    hire_date      employees.hire_date%TYPE;
    sysdate        hire_date%TYPE;
    employee_id   employees.employee_id%TYPE := 176;
BEGIN
    SELECT      hire_date, sysdate
    INTO        hire_date, sysdate
    FROM        employees
    WHERE       employee_id = employee_id;
END;
/
```

```
DECLARE
*
ERROR at line 1:
ORA-01422: exact fetch returns more than requested number of rows
ORA-06512: at line 6
```

ORACLE®

4-11

Copyright © 2004, Oracle. All rights reserved.

Naming Conventions

In potentially ambiguous SQL statements, the names of database columns take precedence over the names of local variables. The example shown in the slide is defined as follows: Retrieve the hire date and today's date from the `employees` table for `employee_id` 176. This example raises an unhandled run-time exception because in the `WHERE` clause, the PL/SQL variable names are the same as that of the database column names in the `employees` table.

The following `DELETE` statement removes all employees from the `employees` table where the last name is not null, not just "King," because the Oracle server assumes that both occurrences of `last_name` in the `WHERE` clause refer to the database column:

```
DECLARE
    last_name  VARCHAR2(25) := 'King';
BEGIN
    DELETE FROM employees WHERE last_name = last_name;
    .
    .
```

Naming Conventions

- Use a naming convention to avoid ambiguity in the WHERE clause.
- Avoid using database column names as identifiers.
- Syntax errors can arise because PL/SQL checks the database first for a column in the table.
- The names of local variables and formal parameters take precedence over the names of database *tables*.
- The names of database table *columns* take precedence over the names of local variables.

ORACLE®

4-12

Copyright © 2004, Oracle. All rights reserved.

Naming Conventions (continued)

Avoid ambiguity in the WHERE clause by adhering to a naming convention that distinguishes database column names from PL/SQL variable names.

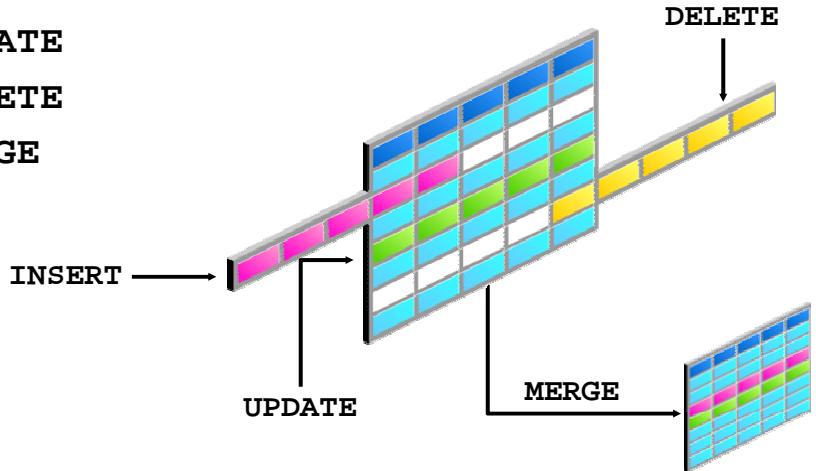

- Database columns and identifiers should have distinct names.
- Syntax errors can arise because PL/SQL checks the database first for a column in the table.

Note: There is no possibility for ambiguity in the SELECT clause because any identifier in the SELECT clause must be a database column name. There is no possibility for ambiguity in the INTO clause because identifiers in the INTO clause must be PL/SQL variables. There is the possibility of a confusion only in the WHERE clause.

Manipulating Data Using PL/SQL

Make changes to database tables by using DML commands:

- **INSERT**
- **UPDATE**
- **DELETE**
- **MERGE**

ORACLE®

4-13

Copyright © 2004, Oracle. All rights reserved.

Manipulating Data Using PL/SQL

You manipulate data in the database by using the DML commands. You can issue the DML commands **INSERT**, **UPDATE**, **DELETE** and **MERGE** without restriction in PL/SQL. Row locks (and table locks) are released by including **COMMIT** or **ROLLBACK** statements in the PL/SQL code.

- The **INSERT** statement adds new rows to the table.
- The **UPDATE** statement modifies existing rows in the table.
- The **DELETE** statement removes rows from the table.
- The **MERGE** statement selects rows from one table to update or insert into another table. The decision whether to update or insert into the target table is based on a condition in the **ON** clause.

Note: **MERGE** is a deterministic statement. That is, you cannot update the same row of the target table multiple times in the same **MERGE** statement. You must have **INSERT** and **UPDATE** object privileges in the target table and the **SELECT** privilege on the source table.

Inserting Data

Add new employee information to the EMPLOYEES table.

Example:

```
BEGIN
  INSERT INTO employees
  (employee_id, first_name, last_name, email,
   hire_date, job_id, salary)
  VALUES(employees_seq.NEXTVAL, 'Ruth', 'Cores',
   'RCORES',sysdate, 'AD_ASST', 4000);
END;
/
```

ORACLE®

4-14

Copyright © 2004, Oracle. All rights reserved.

Inserting Data

In the example in the slide, an `INSERT` statement is used within a PL/SQL block to insert a record into the `employees` table. While using the `INSERT` command in a PL/SQL block, you can:

- Use SQL functions, such as `USER` and `SYSDATE`
- Generate primary key values by using existing database sequences
- Derive values in the PL/SQL block

Note: The data in the `employees` table needs to remain unchanged and therefore inserting, updating, and deleting is not allowed on this table.

Updating Data

Increase the salary of all employees who are stock clerks.

Example:

```
DECLARE
    sal_increase    employees.salary%TYPE := 800;
BEGIN
    UPDATE      employees
    SET          salary = salary + sal_increase
    WHERE        job_id = 'ST_CLERK';
END;
/
```

ORACLE®

4-15

Copyright © 2004, Oracle. All rights reserved.

Updating Data

There may be ambiguity in the SET clause of the UPDATE statement because although the identifier on the left of the assignment operator is always a database column, the identifier on the right can be either a database column or a PL/SQL variable. Recall that if column names and identifier names are identical in the WHERE clause, the Oracle server looks to the database first for the name.

Remember that the WHERE clause is used to determine which rows are affected. If no rows are modified, no error occurs, unlike the SELECT statement in PL/SQL.

Note: PL/SQL variable assignments always use `:=`, and SQL column assignments always use `=`.

Deleting Data

Delete rows that belong to department 10 from the employees table.

Example:

```
DECLARE
    deptno    employees.department_id%TYPE := 10;
BEGIN
    DELETE FROM    employees
    WHERE    department_id = deptno;
END;
/
```

ORACLE®

4-16

Copyright © 2004, Oracle. All rights reserved.

Deleting Data

The DELETE statement removes unwanted rows from a table. If the WHERE clause is not used, all the rows in a table can be removed, provided there are no integrity constraints.

Merging Rows

Insert or update rows in the copy_emp table to match the employees table.

```
DECLARE
    empno employees.employee_id%TYPE := 100;
BEGIN
MERGE INTO copy_emp c
    USING employees e
    ON (e.employee_id = empno)
WHEN MATCHED THEN
    UPDATE SET
        c.first_name      = e.first_name,
        c.last_name       = e.last_name,
        c.email           = e.email,
        . . .
WHEN NOT MATCHED THEN
    INSERT VALUES(e.employee_id, e.first_name, e.last_name,
        . . .,e.department_id);
END;
/
```

ORACLE®

4-17

Copyright © 2004, Oracle. All rights reserved.

Merging Rows

The MERGE statement inserts or updates rows in one table, using data from another table. Each row is inserted or updated in the target table, depending upon an equijoin condition. The example shown matches the employee_id in the COPY_EMP table to the employee_id in the employees table. If a match is found, the row is updated to match the row in the employees table. If the row is not found, it is inserted into the copy_emp table.

The complete example for using MERGE in a PL/SQL block is shown in the next page.

Merging Rows (continued)

```
DECLARE
    empno EMPLOYEES.EMPLOYEE_ID%TYPE := 100;
BEGIN
    MERGE INTO copy_emp c
        USING employees e
        ON (e.employee_id = empno)
    WHEN MATCHED THEN
        UPDATE SET
            c.first_name      = e.first_name,
            c.last_name       = e.last_name,
            c.email           = e.email,
            c.phone_number    = e.phone_number,
            c.hire_date       = e.hire_date,
            c.job_id          = e.job_id,
            c.salary          = e.salary,
            c.commission_pct  = e.commission_pct,
            c.manager_id      = e.manager_id,
            c.department_id   = e.department_id
    WHEN NOT MATCHED THEN
        INSERT VALUES(e.employee_id, e.first_name, e.last_name,
                      e.email, e.phone_number, e.hire_date, e.job_id,
                      e.salary, e.commission_pct, e.manager_id,
                      e.department_id);
END;
/
```

SQL Cursor

- **A cursor is a pointer to the private memory area allocated by the Oracle server.**
- **There are two types of cursors:**
 - **Implicit cursors: Created and managed internally by the Oracle server to process SQL statements**
 - **Explicit cursors: Explicitly declared by the programmer**

ORACLE®

4-19

Copyright © 2004, Oracle. All rights reserved.

SQL Cursor

You have already learned that you can include SQL statements that return a single row in a PL/SQL block. The data retrieved by the SQL statement should be held in variables using the INTO clause.

Where Does Oracle Process SQL Statements?

The Oracle server allocates a private memory area called the context area for processing SQL statements. The SQL statement is parsed and processed in this area. Information required for processing and the information retrieved after processing is all stored in this area. Because this area is internally managed by the Oracle server, you have no control over this area. A cursor is a pointer to the context area. However, this cursor is an implicit cursor and is automatically managed by the Oracle server. When the executable block issues a SQL statement, PL/SQL creates an implicit cursor.

There are two types of cursors:

- **Implicit cursors:** Implicit cursors are created and managed by the Oracle server. You do not have access to them. The Oracle server creates such a cursor when it has to execute a SQL statement.

SQL Cursor (continued)

- **Explicit cursors:** As a programmer you may want to retrieve multiple rows from a database table, have a pointer to each row that is retrieved, and work on the rows one at a time. In such cases, you can declare cursors explicitly depending on your business requirements. Such cursors that are declared by programmers are called explicit cursors. You declare these cursors in the declarative section of a PL/SQL block. Remember that you can also declare variables and exceptions in the declarative section.

SQL Cursor Attributes for Implicit Cursors

Using SQL cursor attributes, you can test the outcome of your SQL statements.

SQL%FOUND	Boolean attribute that evaluates to TRUE if the most recent SQL statement returned at least one row.
SQL%NOTFOUND	Boolean attribute that evaluates to TRUE if the most recent SQL statement did not return even one row.
SQL%ROWCOUNT	An integer value that represents number of rows affected by the most recent SQL statement.

ORACLE®

4-21

Copyright © 2004, Oracle. All rights reserved.

SQL Cursor Attributes for Implicit Cursors

SQL cursor attributes allow you to evaluate what happened when an implicit cursor was last used. Use these attributes in PL/SQL statements, but not in SQL statements.

You can test the attributes `SQL%ROWCOUNT`, `SQL%FOUND`, and `SQL%NOTFOUND` in the executable section of a block to gather information after the appropriate DML command. PL/SQL does not return an error if a DML statement does not affect any rows in the underlying table. However, if a SELECT statement does not retrieve any rows, PL/SQL returns an exception.

Observe that the attributes are prefixed with `SQL`. These cursor attributes are used with implicit cursors that are automatically created by PL/SQL and for which you do not know the names. Therefore, you use `SQL` instead of the cursor name.

The `SQL%NOTFOUND` attribute is opposite to `SQL%FOUND`. This attribute may be used as the exit condition in a loop. It is useful in UPDATE or DELETE statements when no rows are changed because exceptions are not returned in these cases.

You will learn about explicit cursor attributes later in the course.

SQL Cursor Attributes for Implicit Cursors

Delete rows that have the specified employee ID from the employees table. Print the number of rows deleted.

Example:

```
VARIABLE rows_deleted VARCHAR2(30)
DECLARE
    empno employees.employee_id%TYPE := 176;
BEGIN
    DELETE FROM employees
    WHERE employee_id = empno;
    :rows_deleted := (SQL%ROWCOUNT ||
                      ' row deleted.');
END;
/
PRINT rows_deleted
```

ORACLE

4-22

Copyright © 2004, Oracle. All rights reserved.

SQL Cursor Attributes for Implicit Cursors (continued)

The example in the slide deletes a row with employee_id 176 from the employees table. Using the SQL%ROWCOUNT attribute, you can print the number of rows deleted.

Summary

In this lesson, you should have learned how to:

- **Embed DML statements, transaction control statements, and DDL statements in PL/SQL**
- **Use the INTO clause, which is mandatory for all SELECT statements in PL/SQL**
- **Differentiate between implicit cursors and explicit cursors**
- **Use SQL cursor attributes to determine the outcome of SQL statements**

ORACLE®

4-23

Copyright © 2004, Oracle. All rights reserved.

Summary

The DML commands and transaction control statements can be used in PL/SQL programs without any restriction. However, the DDL commands cannot be used directly. A SELECT statement in PL/SQL block can return only one row. It is mandatory to use the INTO clause to hold the values retrieved by the SELECT statement. The Oracle server allocates memory area for processing the SQL statements in a PL/SQL block. A cursor is a pointer to the memory area. There are two types of cursors. Implicit cursors are created and managed internally by the Oracle server to execute the SQL statements. You can use SQL cursor attributes with these cursors to determine the outcome of the SQL statement. Explicit cursors are declared by programmers.

Practice 4: Overview

This practice covers the following topics:

- Selecting data from a table
- Inserting data into a table
- Updating data in a table
- Deleting a record from a table

Practice 4: Overview

In this practice, you write PL/SQL blocks with SQL statements to select, insert, update, and delete information in a table.

Practice 4

1. Create a PL/SQL block that selects the maximum department ID in the departments table and stores it in the max_deptno variable. Display the maximum department ID.
 - a. Declare a variable max_deptno of type NUMBER in the declarative section.
 - b. Start the executable section with the keyword BEGIN and include a SELECT statement to retrieve the maximum department_id from the departments table.
 - c. Display max_deptno and end the executable block.
 - d. Execute and save your script as lab_04_01_soln.sql. Sample output is shown below.

The maximum department_id is : 270
PL/SQL procedure successfully completed.

2. Modify the PL/SQL block you created in exercise 1 to insert a new department into the departments table.
 - a. Load the script lab_04_01_soln.sql. Declare two variables: dept_name of type department.department_name. Bind variable dept_id of type NUMBER. Assign 'Education' to dept_name in the declarative section.
 - b. You have already retrieved the current maximum department number from the departments table. Add 10 to it and assign the result to dept_id.
 - c. Include an INSERT statement to insert data into the department_name, department_id, and location_id columns of the departments table. Use values in dept_name, dept_id for department_name, department_id and use NULL for location_id.
 - d. Use the SQL attribute SQL%ROWCOUNT to display the number of rows that are affected.
 - e. Execute a select statement to check if the new department is inserted. You can terminate the PL/SQL block with "/" and include the SELECT statement in your script.
 - f. Execute and save your script as lab_04_02_soln.sql. Sample output is shown below.

The maximum department_id is : 270
SQL%ROWCOUNT gives 1
PL/SQL procedure successfully completed.

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
280	Education		

Practice 4 (continued)

3. In exercise 2, you have set location_id to null. Create a PL/SQL block that updates the location_id to 3000 for the new department. Use the bind variable dept_id to update the row.

Note: Skip step a if you have not started a new *iSQL*Plus* session for this practice.

- a. If you have started a new *iSQL*Plus* session, delete the department that you have added to the departments table and execute the script lab_04_02_soln.sql.
- b. Start the executable block with the keyword BEGIN. Include the UPDATE statement to set the location_id to 3000 for the new department. Use the bind variable dept_id in your UPDATE statement.
- c. End the executable block with the keyword END. Terminate the PL/SQL block with “/” and include a SELECT statement to display the department that you updated.
- d. Finally include a DELETE statement to delete the department that you added.
- e. Execute and save your script as lab_04_03_soln.sql. Sample output is shown below.

PL/SQL procedure successfully completed.

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
280	Education		3000

1 row deleted.

4. Load the script lab_03_05b.sql to the *iSQL*Plus* workspace.
 - a. Observe that the code has nested blocks. You will see the declarative section of the outer block. a. Look for the comment “INCLUDE EXECUTABLE SECTION OF OUTER BLOCK HERE” and start an executable section
 - b. Include a single SELECT statement, which retrieves the employee_id of the employee working in the ‘Human Resources’ department. Use the INTO clause to store the retrieved value in the variable emp_authorization.
 - c. Save your script as lab_04_04_soln.sql.

Writing Control Structures

5

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- **Identify the uses and types of control structures**
- **Construct an IF statement**
- **Use CASE statements and CASE expressions**
- **Construct and identify different loop statements**
- **Make use of guidelines while using the conditional control structures**

ORACLE®

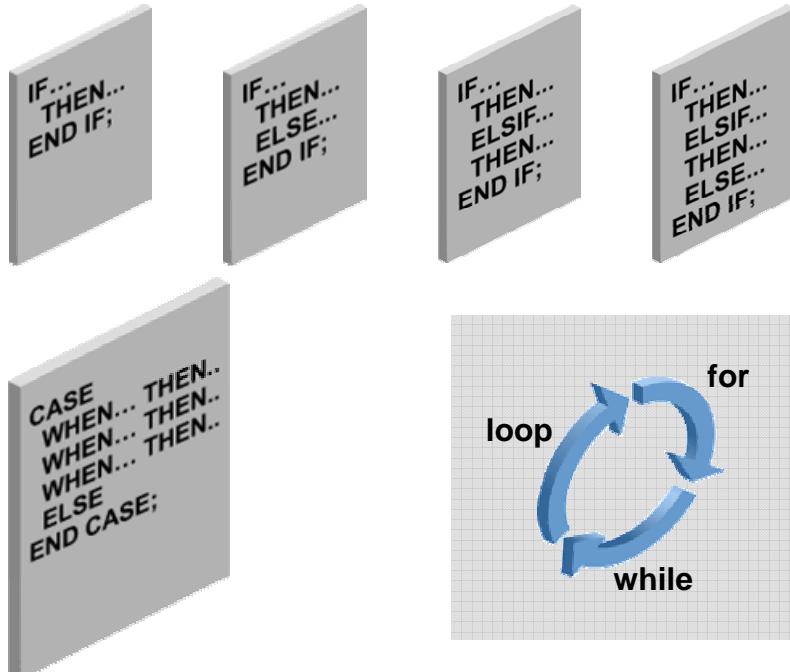

5-2

Copyright © 2004, Oracle. All rights reserved.

Lesson Aim

You have learned to write PL/SQL blocks with declarative and executable sections in them. You have also learned to include expressions and SQL statements in the executable block. In this lesson, you learn how to use control structures such as IF statements, CASE expressions, and LOOP structures in a PL/SQL block.

Controlling Flow of Execution

Controlling Flow of Execution

You can change the logical flow of statements within the PL/SQL block with a number of control structures. This lesson addresses three types of PL/SQL control structures: conditional constructs with the IF statement, CASE expressions, and LOOP control structures.

IF Statements

Syntax:

```
IF condition THEN
    statements;
[ELSIF condition THEN
    statements;]
[ELSE
    statements;]
END IF;
```

IF Statements

The structure of the PL/SQL IF statement is similar to the structure of IF statements in other procedural languages. It allows PL/SQL to perform actions selectively based on conditions.

In the syntax:

- | | |
|-------------------|---|
| <i>condition</i> | Is a Boolean variable or expression that returns TRUE, FALSE, or NULL |
| THEN | Introduces a clause that associates the Boolean expression with the sequence of statements that follows it |
| <i>statements</i> | Can be one or more PL/SQL or SQL statements. (They may include further IF statements containing several nested IF, ELSE, and ELSIF statements.) The statements in the THEN clause are executed only if the condition in the associated IF clause evaluates to TRUE. |

IF Statements (continued)

In the syntax:

- ELSIF Is a keyword that introduces a Boolean expression (If the first condition yields FALSE or NULL, then the ELSIF keyword introduces additional conditions.)
- ELSE Introduces the default clause which is executed if and only if none of the earlier predicates (introduced by IF and ELSIF) is TRUE. The tests are executed in sequence so that a later predicate which might be true is pre-empted by an earlier predicate which is true.
- END IF END IF marks the end of an IF statement.

Note: ELSIF and ELSE are optional in an IF statement. You can have any number of ELSIF but only one ELSE keyword in your IF statement. END IF marks the end of an IF statement and must be terminated by a semicolon.

Simple IF Statement

```
DECLARE
    myage number:=31;
BEGIN
    IF myage < 11
    THEN
        DBMS_OUTPUT.PUT_LINE(' I am a child ');
    END IF;
END;
/
```

PL/SQL procedure successfully completed.

ORACLE®

5-6

Copyright © 2004, Oracle. All rights reserved.

Simple IF Statement

The slide shows an example of a simple IF statement with the THEN clause. The variable myage is initialized to 31. The condition for the IF statement returns FALSE, because myage is not less than 11. Therefore the control never reaches the THEN clause. We will add code to this example to see the usage of ELSE, and ELSIF.

An IF statement can have multiple conditional expressions related with logical operators such as AND, OR, and NOT.

For example:

```
IF (myfirstname='Christopher' AND myage <11)
...
...
```

The condition uses the AND operator and therefore it evaluates to TRUE only if both the above conditions are evaluated as TRUE. There is no limitation on the number of conditional expressions, however these statements must be related with appropriate logical operators.

IF THEN ELSE Statement

```
SET SERVEROUTPUT ON
DECLARE
myage number:=31;
BEGIN
IF myage < 11
THEN
    DBMS_OUTPUT.PUT_LINE(' I am a child ');
ELSE
    DBMS_OUTPUT.PUT_LINE(' I am not a child ');
END IF;
END;
/
```

I am not a child
PL/SQL procedure successfully completed.

ORACLE®

5-7

Copyright © 2004, Oracle. All rights reserved.

IF THEN ELSE Statement

ELSE clause is added to the code in the previous slide. The condition has not changed and therefore it still evaluates to FALSE. Recollect that the statements in the THEN clause are executed only if the condition returns TRUE. In this case, the condition returns FALSE and therefore the control moves to the ELSE statement. The output of the block is shown in the slide.

IF ELSIF ELSE Clause

```
DECLARE
myage number:=31;
BEGIN
IF myage < 11
THEN
    DBMS_OUTPUT.PUT_LINE(' I am a child ');
ELSIF myage < 20
THEN
    DBMS_OUTPUT.PUT_LINE(' I am young ');
ELSIF myage < 30
THEN
    DBMS_OUTPUT.PUT_LINE(' I am in my twenties');
ELSIF myage < 40
THEN
    DBMS_OUTPUT.PUT_LINE(' I am in my thirties');
ELSE
    DBMS_OUTPUT.PUT_LINE(' I am always young ');
END IF;
END;
/
```

I am in my thirties
PL/SQL procedure successfully completed.

ORACLE®

IF ELSIF ELSE Clause

The IF clause now contains multiple ELSIF clauses and an ELSE. Observe that the ELSIF clauses can have conditions unlike the ELSE clause. The condition for ELSIF should be followed by the THEN clause which is executed if the condition of the ELSIF returns TRUE. When you have multiple ELSIF clauses, if the first condition is FALSE or NULL, the control shifts to the next ELSIF clause. Conditions are evaluated one by one from the top. If all conditions are FALSE or NULL, the statements in the ELSE clause are executed. The final ELSE clause is optional.

NULL Values in IF Statements

```
DECLARE
myage number;
BEGIN
IF myage < 11
THEN
    DBMS_OUTPUT.PUT_LINE(' I am a child ');
ELSE
    DBMS_OUTPUT.PUT_LINE(' I am not a child ');
END IF;
END;
/
```

I am not a child
PL/SQL procedure successfully completed.

ORACLE®

5-9

Copyright © 2004, Oracle. All rights reserved.

NULL Values in IF Statements

In the example shown in the slide, the variable `myage` is declared but is not initialized. The condition in the `IF` statement returns `NULL`, and not `TRUE` or `FALSE`. In such a case, the control goes to the `ELSE` statement.

Guidelines:

- You can perform actions selectively based on conditions that are being met.
- When writing code, remember the spelling of the keywords:
 - `ELSIF` is one word
 - `END IF` is two words
- If the controlling Boolean condition is `TRUE`, the associated sequence of statements is executed; if the controlling Boolean condition is `FALSE` or `NULL`, the associated sequence of statements is passed over. Any number of `ELSIF` clauses is permitted.
- Indent the conditionally executed statements for clarity.

CASE Expressions

- A CASE expression selects a result and returns it.
- To select the result, the CASE expression uses expressions. The value returned by these expressions is used to select one of several alternatives.

```
CASE selector
    WHEN expression1 THEN result1
    WHEN expression2 THEN result2
    ...
    WHEN expressionN THEN resultN
    [ELSE resultN+1]
END;
/
```

ORACLE®

5-10

Copyright © 2004, Oracle. All rights reserved.

CASE Expressions

A CASE expression returns a result based on one or more alternatives. To return the result, the CASE expression uses a selector, an expression whose value is used to return one of several alternatives. The selector is followed by one or more WHEN clauses, which are checked sequentially. The value of the selector determines which result is returned. If the value of the selector equals the value of a WHEN clause expression, that WHEN clause is executed and that result is returned.

PL/SQL also provides a searched CASE expression, which has the form:

```
CASE
    WHEN search_condition1 THEN result1
    WHEN search_condition2 THEN result2
    ...
    WHEN search_conditionN THEN resultN
    [ELSE resultN+1]
END;
```

A searched CASE expression has no selector. Also, its WHEN clauses contain search conditions that yield a Boolean value, not expressions that can yield a value of any type.

CASE Expressions: Example

```
SET SERVEROUTPUT ON
SET VERIFY OFF
DECLARE
    grade CHAR(1) := UPPER('&grade');
    appraisal VARCHAR2(20);
BEGIN
    appraisal :=
        CASE grade
            WHEN 'A' THEN 'Excellent'
            WHEN 'B' THEN 'Very Good'
            WHEN 'C' THEN 'Good'
            ELSE 'No such grade'
        END;
    DBMS_OUTPUT.PUT_LINE ('Grade: '|| grade || '
                           Appraisal ' || appraisal);
END;
/
```

ORACLE®

5-11

Copyright © 2004, Oracle. All rights reserved.

CASE Expressions: Example

In the example in the slide, the CASE expression uses the value in the grade variable as the expression. This value is accepted from the user using a substitution variable. Based on the value entered by the user, the CASE expression returns the value of the appraisal variable based on the value of the grade value. The output of the above example will be as follows when you input “a” or “A” for the grade:

Grade: A Appraisal Excellent
PL/SQL procedure successfully completed.

Searched CASE Expressions

```
DECLARE
    grade CHAR(1) := UPPER('&grade');
    appraisal VARCHAR2(20);
BEGIN
    appraisal :=
        CASE
            WHEN grade = 'A' THEN 'Excellent'
            WHEN grade IN ('B','C') THEN 'Good'
            ELSE 'No such grade'
        END;
    DBMS_OUTPUT.PUT_LINE ('Grade: '|| grade || ' '
                           || appraisal);
END;
/
```

ORACLE®

5-12

Copyright © 2004, Oracle. All rights reserved.

Searched CASE Expressions

In the previous example you have a single test expression that is the grade variable. The WHEN clause compares a value against this test expression. In searched CASE statements you will not have a test expression; instead, the WHEN clause will contain an expression which results in a Boolean value. The same example is rewritten to show searched CASE statements.

CASE Statement

```
DECLARE
    deptid NUMBER;
    deptname VARCHAR2(20);
    emps NUMBER;
    mngid NUMBER:= 108;
BEGIN
    CASE mngid
        WHEN 108 THEN
            SELECT department_id, department_name
            INTO deptid, deptname FROM departments
            WHERE manager_id=108;
            SELECT count(*) INTO emps FROM employees
            WHERE department_id=deptid;
        WHEN 200 THEN
            ...
    END CASE;
    DBMS_OUTPUT.PUT_LINE ('You are working in the '|| deptname ||
        ' department. There are '|| emps || ' employees in this
        department');
END;
/
```

ORACLE

5-13

Copyright © 2004, Oracle. All rights reserved.

CASE Statement

Remember the usage of the IF statement. You may include n number of PL/SQL statements in the THEN clause and also the ELSE clause. Similarly you can include statements in the CASE statement. The CASE statement is more readable compared to multiple IF and ELSIF statements.

How Is CASE Expression Different from the CASE Statement?

The CASE expression evaluates the condition and returns a value. Whereas, CASE statement evaluates the condition and performs an action. A CASE statement can be a complete PL/SQL block. CASE statements end with END CASE ; as opposed to CASE expressions ending with END ;.

Handling Nulls

When working with nulls, you can avoid some common mistakes by keeping in mind the following rules:

- **Simple comparisons involving nulls always yield NULL.**
- **Applying the logical operator NOT to a null yields NULL.**
- **In conditional control statements, if the condition yields NULL, its associated sequence of statements is not executed.**

ORACLE®

5-14

Copyright © 2004, Oracle. All rights reserved.

Handling Nulls

Consider the following example:

```
x := 5;  
y := NULL;  
...  
IF x != y THEN -- yields NULL, not TRUE  
    -- sequence_of_statements that are not executed  
END IF;
```

You may expect the sequence of statements to execute because *x* and *y* seem unequal. But, nulls are indeterminate. Whether or not *x* is equal to *y* is unknown. Therefore, the IF condition yields NULL and the sequence of statements is bypassed.

```
a := NULL;  
b := NULL;  
...  
IF a = b THEN -- yields NULL, not TRUE  
    -- sequence_of_statements that are not executed  
END IF;
```

In the second example, you may expect the sequence of statements to execute because *a* and *b* seem equal. But, again, equality is unknown, so the IF condition yields NULL and the sequence of statements is bypassed.

Logic Tables

Build a simple Boolean condition with a comparison operator.

AND	TRUE	FALSE	NULL	OR	TRUE	FALSE	NULL	NOT	
TRUE	TRUE	FALSE	NULL	TRUE	TRUE	TRUE	TRUE	TRUE	FALSE
FALSE	FALSE	FALSE	FALSE	FALSE	TRUE	FALSE	NULL	FALSE	TRUE
NULL	NULL	FALSE	NULL	NULL	TRUE	NULL	NULL	NULL	NULL

ORACLE®

5-15

Copyright © 2004, Oracle. All rights reserved.

Logic Tables

You can build a simple Boolean condition by combining number, character, or date expressions with comparison operators.

You can build a complex Boolean condition by combining simple Boolean conditions with the logical operators AND, OR, and NOT. The logical operators are used to check the Boolean variable values and return TRUE, FALSE, or NULL. In the logic tables shown in the slide:

- FALSE takes precedence in an AND condition and TRUE takes precedence in an OR condition.
- AND returns TRUE only if both of its operands are TRUE.
- OR returns FALSE only if both of its operands are FALSE.
- NULL AND TRUE always evaluate to NULL because it is not known whether the second operand evaluates to TRUE or not.

Note: The negation of NULL (NOT NULL) results in a null value because null values are indeterminate.

Boolean Conditions

What is the value of flag in each case?

```
flag := reorder_flag AND available_flag;
```

REORDER_FLAG	AVAILABLE_FLAG	FLAG
TRUE	TRUE	?
TRUE	FALSE	?
NULL	TRUE	?
NULL	FALSE	?

ORACLE®

5-16

Copyright © 2004, Oracle. All rights reserved.

Boolean Conditions

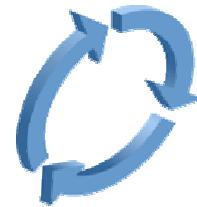

The AND logic table can help you evaluate the possibilities for the Boolean condition in the slide.

Answers

1. TRUE
2. FALSE
3. NULL
4. FALSE

Iterative Control: LOOP Statements

- Loops repeat a statement or sequence of statements multiple times.
- There are three loop types:
 - Basic loop
 - FOR loop
 - WHILE loop

ORACLE®

5-17

Copyright © 2004, Oracle. All rights reserved.

Iterative Control: LOOP Statements

PL/SQL provides a number of facilities to structure loops to repeat a statement or sequence of statements multiple times. Loops are mainly used to execute statements repeatedly until an exit condition is reached. It is mandatory to have an exit condition in a loop, or else the loop will be infinite.

Looping constructs are the second type of control structure. PL/SQL provides the following types of loops:

- Basic loop that performs repetitive actions without overall conditions
- FOR loops that perform iterative actions based on a count
- WHILE loops that perform iterative actions based on a condition

Note: An EXIT statement can be used to terminate loops. A basic loop must have an EXIT. Another type of FOR LOOP, cursor FOR LOOP, is discussed in the lesson titled “Using Explicit Cursors.”

Basic Loops

Syntax:

```
LOOP  
    statement1;  
    . . .  
    EXIT [WHEN condition];  
END LOOP;
```

Basic Loops

The simplest form of a LOOP statement is the basic (or infinite) loop, which encloses a sequence of statements between the keywords LOOP and END LOOP. Each time the flow of execution reaches the END LOOP statement, control is returned to the corresponding LOOP statement above it. A basic loop allows execution of its statements at least once, even if the EXIT condition is already met upon entering the loop. Without the EXIT statement, the loop would be infinite.

The EXIT Statement

You can use the EXIT statement to terminate a loop. Control passes to the next statement after the END LOOP statement. You can issue EXIT either as an action within an IF statement or as a stand-alone statement within the loop. The EXIT statement must be placed inside a loop. In the latter case, you can attach a WHEN clause to allow conditional termination of the loop. When the EXIT statement is encountered, the condition in the WHEN clause is evaluated. If the condition yields TRUE, the loop ends and control passes to the next statement after the loop. A basic loop can contain multiple EXIT statements but it is recommended to have only one EXIT point.

Basic Loops

Example:

```
DECLARE
    countryid      locations.country_id%TYPE := 'CA';
    loc_id         locations.location_id%TYPE;
    counter        NUMBER(2) := 1;
    new_city       locations.city%TYPE := 'Montreal';
BEGIN
    SELECT MAX(location_id) INTO loc_id FROM locations
    WHERE country_id = countryid;
    LOOP
        INSERT INTO locations(location_id, city, country_id)
        VALUES((loc_id + counter), new_city, countryid);
        counter := counter + 1;
        EXIT WHEN counter > 3;
    END LOOP;
END;
/
```

ORACLE

5-19

Copyright © 2004, Oracle. All rights reserved.

Basic Loops (continued)

The basic loop example shown in the slide is defined as follows: Insert three new location IDs for the country code of CA and the city of Montreal.

Note: A basic loop allows execution of its statements at least once, even if the condition has been met upon entering the loop. This happens only if the condition is placed in the loop so that it is not checked until after these statements. However, if the exit condition is placed at the top of the loop, before any of the other executable statements, and that condition is true, the loop will exit and the statements will never execute.

WHILE Loops

Syntax:

```
WHILE condition LOOP
    statement1;
    statement2;
    . . .
END LOOP;
```

Use the WHILE loop to repeat statements while a condition is TRUE.

ORACLE®

5-20

Copyright © 2004, Oracle. All rights reserved.

WHILE Loops

You can use the WHILE loop to repeat a sequence of statements until the controlling condition is no longer TRUE. The condition is evaluated at the start of each iteration. The loop terminates when the condition is FALSE or NULL. If the condition is FALSE or NULL at the start of the loop, then no further iterations are performed.

In the syntax:

condition Is a Boolean variable or expression (TRUE, FALSE, or NULL)

statement Can be one or more PL/SQL or SQL statements

If the variables involved in the conditions do not change during the body of the loop, then the condition remains TRUE and the loop does not terminate.

Note: If the condition yields NULL, then the loop is bypassed and control passes to the next statement.

WHILE Loops

Example:

```
DECLARE
    countryid    locations.country_id%TYPE := 'CA';
    loc_id       locations.location_id%TYPE;
    new_city     locations.city%TYPE := 'Montreal';
    counter      NUMBER := 1;
BEGIN
    SELECT MAX(location_id) INTO loc_id FROM locations
    WHERE country_id = countryid;
    WHILE counter <= 3 LOOP
        INSERT INTO locations(location_id, city, country_id)
        VALUES((loc_id + counter), new_city, countryid);
        counter := counter + 1;
    END LOOP;
END;
/
```

ORACLE®

5-21

Copyright © 2004, Oracle. All rights reserved.

WHILE Loops (continued)

In the example in the slide, three new locations IDs for the country code CA and the city of Montreal are being added.

With each iteration through the WHILE loop, a counter (`counter`) is incremented. If the number of iterations is less than or equal to the number 3, then the code within the loop is executed and a row is inserted into the `locations` table. After the counter exceeds the number of new locations for this city and country, the condition that controls the loop evaluates to FALSE and the loop is terminated.

FOR Loops

- Use a FOR loop to shortcut the test for the number of iterations.
- Do not declare the counter; it is declared implicitly.
- 'lower_bound .. upper_bound' is required syntax.

```
FOR counter IN [REVERSE]
    lower_bound..upper_bound LOOP
        statement1;
        statement2;
        . . .
    END LOOP;
```

ORACLE®

5-22

Copyright © 2004, Oracle. All rights reserved.

FOR Loops

FOR loops have the same general structure as the basic loop. In addition, they have a control statement before the LOOP keyword to set the number of iterations that PL/SQL performs.

In the syntax:

<i>counter</i>	Is an implicitly declared integer whose value automatically increases or decreases (decreases if the REVERSE keyword is used) by 1 on each iteration of the loop until the upper or lower bound is reached
REVERSE	Causes the counter to decrement with each iteration from the upper bound to the lower bound (Note that the lower bound is still referenced first.)
<i>lower_bound</i>	Specifies the lower bound for the range of counter values
<i>upper_bound</i>	Specified the upper bound for the range of counter values

Do not declare the counter; it is declared implicitly as an integer.

FOR Loops (continued)

Note: The sequence of statements is executed each time the counter is incremented, as determined by the two bounds. The lower bound and upper bound of the loop range can be literals, variables, or expressions, but must evaluate to integers. The bounds are rounded to integers, that is 11/3 or 8/5 are valid upper or lower bounds. The lower bound and upper bound are inclusive in the loop range. If the lower bound of the loop range evaluates to a larger integer than the upper bound, the sequence of statements will not be executed.

For example, the following statement is executed only once:

```
FOR i IN 3..3
LOOP
    statement1;
END LOOP;
```

FOR Loops

Example:

```
DECLARE
    countryid    locations.country_id%TYPE := 'CA';
    loc_id       locations.location_id%TYPE;
    new_city     locations.city%TYPE := 'Montreal';
BEGIN
    SELECT MAX(location_id) INTO loc_id
        FROM locations
        WHERE country_id = countryid;
    FOR i IN 1..3 LOOP
        INSERT INTO locations(location_id, city, country_id)
        VALUES((loc_id + i), new_city, countryid );
    END LOOP;
END;
/
```

ORACLE®

5-24

Copyright © 2004, Oracle. All rights reserved.

FOR Loops (continued)

You have already learned how to insert three new locations for the country code CA and the city Montreal using the simple LOOP and the WHILE loop. The slide shows you how to achieve the same using the FOR loop.

FOR Loops

Guidelines

- Reference the counter within the loop only; it is undefined outside the loop.
- Do not reference the counter as the target of an assignment.
- Neither loop bound should be NULL.

ORACLE®

5-25

Copyright © 2004, Oracle. All rights reserved.

FOR Loops (continued)

The slide lists the guidelines to follow while writing a FOR loop.

Note: While writing a FOR loop, the lower and upper bounds of a LOOP statement do not need to be numeric literals. They can be expressions that convert to numeric values.

Example:

```
DECLARE
    lower  NUMBER := 1;
    upper  NUMBER := 100;
BEGIN
    FOR i IN lower..upper LOOP
        ...
    END LOOP;
END;
/
```

Guidelines While Using Loops

- Use the basic loop when the statements inside the loop must execute at least once.
- Use the WHILE loop if the condition has to be evaluated at the start of each iteration.
- Use a FOR loop if the number of iterations is known.

ORACLE®

5-26

Copyright © 2004, Oracle. All rights reserved.

Guidelines While Using Loops

A basic loop allows execution of its statement at least once, even if the condition is already met upon entering the loop. Without the EXIT statement, the loop would be infinite.

You can use the WHILE loop to repeat a sequence of statements until the controlling condition is no longer TRUE. The condition is evaluated at the start of each iteration. The loop terminates when the condition is FALSE. If the condition is FALSE at the start of the loop, then no further iterations are performed.

FOR loops have a control statement before the LOOP keyword to determine the number of iterations that PL/SQL performs. Use a FOR loop if the number of iterations is predetermined.

Nested Loops and Labels

- Nest loops to multiple levels.
- Use labels to distinguish between blocks and loops.
- Exit the outer loop with the `EXIT` statement that references the label.

ORACLE®

5-27

Copyright © 2004, Oracle. All rights reserved.

Nested Loops and Labels

You can nest loops to multiple levels. You can nest FOR, WHILE, and basic loops within one another. The termination of a nested loop does not terminate the enclosing loop unless an exception was raised. However, you can label loops and exit the outer loop with the `EXIT` statement.

Label names follow the same rules as other identifiers. A label is placed before a statement, either on the same line or on a separate line. White space is insignificant in all PL/SQL parsing except inside literals. Label basic loops by placing the label before the word `LOOP` within label delimiters (`<<label>>`). In FOR or WHILE loops place the label before `FOR` or `WHILE`.

If the loop is labeled, the label name can optionally be included after the `END LOOP` statement for clarity.

Nested Loops and Labels

```
...
BEGIN
    <<Outer_loop>>
    LOOP
        counter := counter+1;
        EXIT WHEN counter>10;
        <<Inner_loop>>
        LOOP
            ...
            EXIT Outer_loop WHEN total_done = 'YES';
            -- Leave both loops
            EXIT WHEN inner_done = 'YES';
            -- Leave inner loop only
            ...
        END LOOP Inner_loop;
        ...
    END LOOP Outer_loop;
END;
/
```

ORACLE

Nested Loops and Labels (continued)

In the example in the slide, there are two loops. The outer loop is identified by the label, <<Outer_Loop>> and the inner loop is identified by the label <<Inner_Loop>>. The identifiers are placed before the word LOOP within label delimiters (<<label>>). The inner loop is nested within the outer loop. The label names are included after the END LOOP statements for clarity.

Summary

In this lesson, you should have learned how to:

Change the logical flow of statements by using the following control structures.

- **Conditional (`IF` statement)**
- **CASE expressions and CASE statements**
- **Loops:**
 - **Basic loop**
 - **FOR loop**
 - **WHILE loop**
- **EXIT statements**

ORACLE®

5-29

Copyright © 2004, Oracle. All rights reserved.

Summary

A language can be called a programming language only if it provides control structures for the implementation of the business logic. These control structures are also used to control the flow of the program. PL/SQL is a programming language which integrates programming constructs with SQL.

A conditional control construct checks for the validity of a condition and performs an action accordingly. You use the IF construct to perform a conditional execution of statements.

An iterative control construct executes a sequence of statements repeatedly, as long as a specified condition holds TRUE. You use the various loop constructs to perform iterative operations.

Practice 5: Overview

This practice covers the following topics:

- **Performing conditional actions using the IF statement**
- **Performing iterative steps using the loop structure**

Practice 5: Overview

In this practice, you create PL/SQL blocks that incorporate loops and conditional control structures. The practices test the understanding of the student about writing various IF statements and LOOP constructs.

Practice 5

1. Execute the command in the file `lab_05_01.sql` to create the `messages` table. Write a PL/SQL block to insert numbers into the `messages` table.
 - a. Insert the numbers 1 to 10, excluding 6 and 8.
 - b. Commit before the end of the block.
 - c. Execute a `SELECT` statement to verify that your PL/SQL block worked.You should see the following output.

RESULTS
1
2
3
4
5
7
9
10

8 rows selected.

2. Execute the script `lab_05_02.sql`. This script creates an `emp` table that is a replica of the `employees` table. It alters the `emp` table to add a new column, `stars`, of `VARCHAR2` data type and size 50. Create a PL/SQL block that inserts an asterisk in the `stars` column for every \$1000 of the employee's salary. Save your script as `lab_05_02_soln.sql`.
 - a. Use the `DEFINE` command to define a variable called `empno` and initialize it to 176.
 - b. Start the declarative section of the block and pass the value of `empno` to the PL/SQL block through an *i*SQL*Plus substitution variable. Declare a variable `asterisk` of type `emp.stars` and initialize it to `NULL`. Create a variable `sal` of type `emp.salary`.
 - c. In the executable section write logic to append an asterisk (*) to the string for every \$1000 of the salary amount. For example, if the employee earns \$8000, the string of asterisks should contain eight asterisks. If the employee earns \$12500, the string of asterisks should contain 13 asterisks.
 - d. Update the `stars` column for the employee with the string of asterisks. Commit before the end of the block.

Practice 5 (continued)

- e. Display the row from the emp table to verify whether your PL/SQL block has executed successfully.
- f. Execute and save your script as lab_05_02_soln.sql. The output is shown below.

EMPLOYEE_ID	SALARY	STARS
176	8600	*****

3. Load the script lab_04_04_soln.sql, which you created in question 4 of Practice 4.
 - a. Look for the comment “INCLUDE SIMPLE IF STATEMENT HERE” and include a simple IF statement to check if the values of emp_id and emp_authorization are the same.
 - b. Save your script as lab_05_03_soln.sql.

Working with Composite Data Types

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- **Create user-defined PL/SQL records**
- **Create a record with the %ROWTYPE attribute**
- **Create an INDEX BY table**
- **Create an INDEX BY table of records**
- **Describe the difference between records, tables, and tables of records**

ORACLE®

6-2

Copyright © 2004, Oracle. All rights reserved.

Lesson Aim

You have already been introduced to composite data types. In this lesson, you learn more about composite data types and their uses.

Composite Data Types

- **Can hold multiple values, unlike scalar types**
- **Are of two types:**
 - PL/SQL records
 - PL/SQL collections
 - INDEX BY tables or associative arrays
 - Nested table
 - VARRAY

ORACLE®

6-3

Copyright © 2004, Oracle. All rights reserved.

Composite Data Types

You have learned that variables of scalar data type can hold only one value whereas a variable of composite data type can hold multiple values of scalar data type or composite data type. There are two types of composite data types:

- **PL/SQL records:** PL/SQL records are used to treat related but dissimilar data as a logical unit. A PL/SQL record can have variables of different types. For example, you can define a record to hold employee details. This involves storing employee number as NUMBER, first name and last name as VARCHAR2, and so on. By creating a record to store employee details, you are creating a logical collective unit. This makes data access and manipulation easier.
- **PL/SQL collections:** Collections are used to treat data as a single unit. Collections are of three types:
 - INDEX BY tables or associative arrays
 - Nested table
 - VARRAY

Why Use Composite Data Types?

You will have all the related data as a single unit. You can easily access and modify the data. Data is easier to manage, relate, and transport if it is composite. Consider having a single bag for all your laptop components instead of having a separate bag for each component.

Composite Data Types

- **Use PL/SQL records when you want to store values of different data types but only one occurrence at a time.**
- **Use PL/SQL collections when you want to store values of same data type.**

ORACLE®

6-4

Copyright © 2004, Oracle. All rights reserved.

Composite Data Types (continued)

If both PL/SQL records and PL/SQL collections are composite types, how do you choose which one to use?

Use PL/SQL records when you want to store values of different data types that are logically related. If you create a record to hold employee details, identify that all the values stored are related because they provide information about a particular employee.

Use PL/SQL collections when you want to store values of the same data type. Note that this data type can also be of the composite type such as records. You can define a collection to hold the first names of all the employees. You may have stored n names in the collection; however, name 1 is not related to name 2. The relation between these names is only that they are employee names. These collections are similar to arrays in programming languages like C, C++, and Java.

PL/SQL Records

- Must contain one or more components of any scalar, RECORD, or INDEX BY table data type, called fields
- Are similar to structures in most 3GL languages including C and C++
- Are user defined and can be a subset of a row in a table
- Treat a collection of fields as a logical unit
- Are convenient for fetching a row of data from a table for processing

ORACLE®

6-5

Copyright © 2004, Oracle. All rights reserved.

PL/SQL Records

A record is a group of related data items stored in fields, each with its own name and data type.

- Each record defined can have as many fields as necessary.
- Records can be assigned initial values and can be defined as NOT NULL.
- Fields without initial values are initialized to NULL.
- The DEFAULT keyword can also be used when defining fields.
- You can define RECORD types and declare user-defined records in the declarative part of any block, subprogram, or package.
- You can declare and reference nested records. One record can be the component of another record.

Creating a PL/SQL Record

Syntax:

1

```
TYPE type_name IS RECORD  
  (field_declaration[, field_declaration]...);
```

2

```
identifier  type_name;
```

field_declaration:

```
field_name {field_type | variable%TYPE  
           | table.column%TYPE | table%ROWTYPE}  
[[NOT NULL] {:= | DEFAULT} expr]
```

ORACLE®

6-6

Copyright © 2004, Oracle. All rights reserved.

Creating a PL/SQL Record

PL/SQL records are user-defined composite types. To use them:

1. You have to define the record in the declarative section of a PL/SQL block. The syntax for defining the record is shown in the slide.
2. You have to declare and optionally initialize the internal components of this record type.

In the syntax:

type_name Is the name of the RECORD type (This identifier is used to declare records.)

field_name Is the name of a field within the record

field_type Is the data type of the field (It represents any PL/SQL data type except REF CURSOR. You can use the %TYPE and %ROWTYPE attributes.)

expr Is the *field_type* or an initial value

The NOT NULL constraint prevents assigning nulls to those fields. Be sure to initialize the NOT NULL fields.

REF CURSOR is covered in appendix C “REF Cursors”.

Creating a PL/SQL Record

Declare variables to store the name, job, and salary of a new employee.

Example:

```
...
TYPE emp_record_type IS RECORD
  (last_name    VARCHAR2(25),
   job_id       VARCHAR2(10),
   salary        NUMBER(8,2));
emp_record      emp_record_type;
...
```

ORACLE®

6-7

Copyright © 2004, Oracle. All rights reserved.

Creating a PL/SQL Record (continued)

Field declarations used in defining a record are like variable declarations. Each field has a unique name and a specific data type. There are no predefined data types for PL/SQL records, as there are for scalar variables. Therefore, you must create the record type first and then declare an identifier using that type.

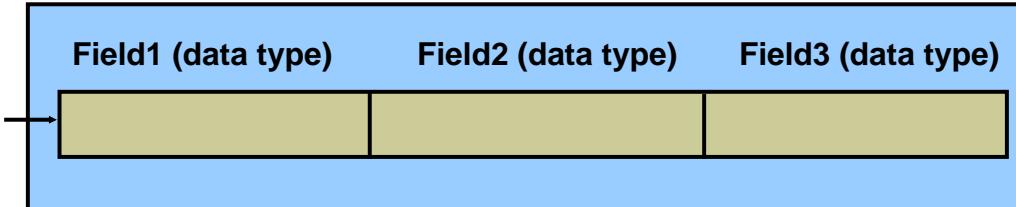

In the example in the slide, a record type (`emp_record_type`) is defined to hold the values for the `last_name`, `job_id`, and `salary`. In the next step, a record (`emp_record`), of the type `emp_record_type` is declared.

The following example shows that you can use the `%TYPE` attribute to specify a field data type:

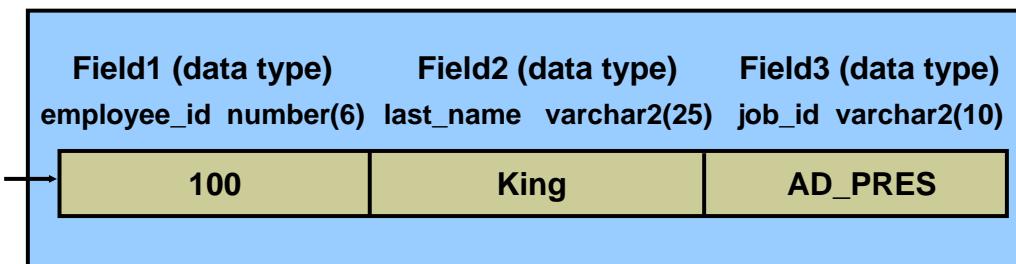

```
DECLARE
  TYPE emp_record_type IS RECORD
    (employee_id    NUMBER(6) NOT NULL := 100,
     last_name      employees.last_name%TYPE,
     job_id         employees.job_id%TYPE);
  emp_record      emp_record_type;
...
```

Note: You can add the NOT NULL constraint to any field declaration to prevent assigning nulls to that field. Remember that the fields declared as NOT NULL must be initialized.

PL/SQL Record Structure

Example:

ORACLE®

PL/SQL Record Structure

Fields in a record are accessed with the name of the record. To reference or initialize an individual field, use the dot notation as shown below:

```
record_name.field_name
```

For example, you reference the `job_id` field in the `emp_record` record as follows:

```
emp_record.job_id
```

You can then assign a value to the record field as follows:

```
emp_record.job_id := 'ST_CLERK';
```

In a block or subprogram, user-defined records are instantiated when you enter the block or subprogram and cease to exist when you exit the block or subprogram.

The %ROWTYPE Attribute

- Declare a variable according to a collection of columns in a database table or view.
- Prefix %ROWTYPE with the database table or view.
- Fields in the record take their names and data types from the columns of the table or view.

Syntax:

```
DECLARE  
    identifier reference%ROWTYPE;
```

ORACLE®

6-9

Copyright © 2004, Oracle. All rights reserved.

The %ROWTYPE Attribute

You have learned that %TYPE is used to declare a variable of a column type. The variable will have the same data type and size as the table column. The benefit of %TYPE is that you will not have to change the variable if the column is altered. Also, if the variable is used in any calculations, you need not worry about its precision.

The %ROWTYPE attribute is used to declare a record that can hold an entire row of a table or view. The fields in the record take their names and data types from the columns of the table or view. The record can also store an entire row of data fetched from a cursor or cursor variable.

The slide shows the syntax for declaring a record. In the syntax:

- identifier* Is the name chosen for the record as a whole
reference Is the name of the table, view, cursor, or cursor variable on which the record is to be based. The table or view must exist for this reference to be valid.

In the following example, a record is declared using %ROWTYPE as a data type specifier.

```
DECLARE  
    emp_record employees%ROWTYPE;  
    ...
```

The %ROWTYPE Attribute (continued)

The `emp_record` record will have a structure consisting of the following fields, each representing a column in the `employees` table.

Note: This is not code, but simply the structure of the composite variable.

```
(employee_id      NUMBER( 6 ) ,
 first_name       VARCHAR2( 20 ) ,
 last_name        VARCHAR2( 20 ) ,
 email            VARCHAR2( 20 ) ,
 phone_number     VARCHAR2( 20 ) ,
 hire_date        DATE ,
 salary            NUMBER( 8 , 2 ) ,
 commission_pct   NUMBER( 2 , 2 ) ,
 manager_id       NUMBER( 6 ) ,
 department_id    NUMBER( 4 ) )
```

To reference an individual field, use dot notation as follows:

```
record_name.field_name
```

For example, you reference the `commission_pct` field in the `emp_record` record as follows:

```
emp_record.commission_pct
```

You can then assign a value to the record field as follows:

```
emp_record.commission_pct := .35;
```

Assigning Values to Records

You can assign a list of common values to a record by using the `SELECT` or `FETCH` statement. Make sure that the column names appear in the same order as the fields in your record. You can also assign one record to another if both have the same corresponding data types. A user-defined record and a `%ROWTYPE` record never have the same data type.

Advantages of Using %ROWTYPE

- **The number and data types of the underlying database columns need not be known.**
- **The number and data types of the underlying database column may change at run time.**
- **The attribute is useful when retrieving a row with the `SELECT *` statement.**

ORACLE®

6-11

Advantages of Using %ROWTYPE

The advantages of using the %ROWTYPE attribute are listed in the slide. Use the %ROWTYPE attribute when you are not sure about the structure of the underlying database table. The main advantage of using %ROWTYPE is that it simplifies maintenance. Using %ROWTYPE ensures that the data types of the variables declared using this attribute change dynamically in case the underlying table is altered. If a DDL statement changes the columns in a table, then the PL/SQL program unit is invalidated. When the program is recompiled it will automatically reflect the new table format. The %ROWTYPE attribute is particularly useful when you want to retrieve an entire row from a table. In the absence of this attribute, you would be forced to declare a variable for each of the columns retrieved by the select statement.

The %ROWTYPE Attribute

```
...
DEFINE employee_number = 124
DECLARE
    emp_rec    employees%ROWTYPE;
BEGIN
    SELECT * INTO emp_rec FROM employees
    WHERE employee_id = &employee_number;
    INSERT INTO retired_emps(empno, ename, job, mgr,
    hiredate, leavedate, sal, comm, deptno)
    VALUES (emp_rec.employee_id, emp_rec.last_name,
    emp_rec.job_id,emp_rec.manager_id,
    emp_rec.hire_date, SYSDATE, emp_rec.salary,
    emp_rec.commission_pct, emp_rec.department_id);
END;
/

```

ORACLE

6-12

Copyright © 2004, Oracle. All rights reserved.

The %ROWTYPE Attribute

An example for the %ROWTYPE attribute is shown in the slide. If an employee is retiring, information about the employee is added to a table that holds information about retired employees. The user supplies the employee's number. The record of the employee specified by the user is retrieved from the employees table and stored into the emp_rec variable, which is declared using the %ROWTYPE attribute.

The record that is inserted into the retired_emps table is shown below:

EMPNO	ENAME	JOB	MGR	HIREDATE	LEAVEDATE	SAL	COMM	DEPTNO
124	Mourgos	ST_MAN	100	16-NOV-99	26-JAN-04	5800		50

Inserting a Record Using %ROWTYPE

```
...
DEFINE employee_number = 124
DECLARE
    emp_rec    retired_emps%ROWTYPE;
BEGIN
    SELECT employee_id, last_name, job_id, manager_id,
    hire_date, hire_date, salary, commission_pct,
    department_id INTO emp_rec FROM employees
    WHERE employee_id = &employee_number;
    INSERT INTO retired_emps VALUES emp_rec;
END;
/
SELECT * FROM retired_emps;
```

ORACLE®

6-13

Copyright © 2004, Oracle. All rights reserved.

Inserting a Record Using %ROWTYPE

Compare the insert statement in the previous slide with the insert statement in this slide. The emp_rec record is of type retired_emps. The number of fields in the record must be equal to the number of field names in the INTO clause. You can use this record to insert values into a table. This makes the code more readable.

The create statement that creates the retired_emps is:

```
CREATE TABLE retired_emps
  (EMPNO        NUMBER(4), ENAME          VARCHAR2(10),
   JOB          VARCHAR2(9), MGR            NUMBER(4),
   HIREDATE     DATE, LEAVEDATE      DATE,
   SAL           NUMBER(7,2), COMM           NUMBER(7,2),
   DEPTNO       NUMBER(2))
```

Observe the select statement in the slide. We are selecting hire_date twice and inserting the hire_date value to the leavedate field of retired_emps. No employee will retire on the hire date. You will see how to update this in the next slide. The record that is inserted is shown below.

EMPNO	ENAME	JOB	MGR	HIREDATE	LEAVEDATE	SAL	COMM	DEPTNO
124	Mourgos	ST_MAN	100	16-NOV-99	16-NOV-99	5800		50

Updating a Row in a Table Using a Record

```
SET SERVEROUTPUT ON
SET VERIFY OFF
DEFINE employee_number = 124
DECLARE
    emp_rec retired_emps%ROWTYPE;
BEGIN
    SELECT * INTO emp_rec FROM retired_emps;
    emp_rec.leavedate:=SYSDATE;
    UPDATE retired_emps SET ROW = emp_rec WHERE
        empno=&employee_number;
END;
/
SELECT * FROM retired_emps;
```

Updating a Row in a Table Using a Record

You have learned to insert a row using a record. The slide shows you how to update a row using a record. The keyword ROW is used to represent the entire row. The code shown in the slide updates the leavedate of the employee. Observe that the record is updated.

EMPNO	ENAME	JOB	MGR	HIREDATE	LEAVEDATE	SAL	COMM	DEPTNO
124	Mourgos	ST_MAN	100	16-NOV-99	27-JAN-04	5800		50

INDEX BY Tables or Associative Arrays

- Are PL/SQL structures with two columns:
 - Primary key type integer or string
 - Column of scalar or record data type
- Are unconstrained in size. However the size depends on the values the key data type can hold.

ORACLE®

6-15

Copyright © 2004, Oracle. All rights reserved.

INDEX BY Tables or Associative Arrays

INDEX BY tables are composite types (collections) and are user defined. INDEX BY tables can store data using a primary key value as the index, where the key values are not sequential. INDEX BY tables are sets of key-value pairs and hence you can imagine data stored in two columns though the key and value pairs are not exactly stored in columns. INDEX BY tables have only two columns:

- A column of type integer or string, which acts as the primary key. The key can be numeric, either BINARY_INTEGER or PLS_INTEGER. BINARY_INTEGER and PLS_INTEGER require less storage than NUMBER. They are used to represent mathematical integers compactly and implement arithmetic operations by using machine arithmetic. Arithmetic operations on these data types are faster than NUMBER arithmetic. The key can also be of type VARCHAR2 or one of its subtypes. The examples in this course use PLS_INTEGER as data type for the key column.
- A column of scalar or record data type to hold values. If the column is of scalar type, it can hold only one value. If the column is of record type, then it can hold multiple values.

The INDEX BY tables are unconstrained for size. However, the key in the PLS_INTEGER column is restricted to the maximum value that a PLS_INTEGER can hold. Note that the keys can be both positive and negative. The keys in INDEX BY tables are not in sequence.

Creating an INDEX BY Table

Syntax:

```
TYPE type_name IS TABLE OF
    {column_type | variable%TYPE
     | table.column%TYPE} [NOT NULL]
     | table%ROWTYPE
    [INDEX BY PLS_INTEGER | BINARY_INTEGER
     | VARCHAR2(<size>)];
identifier      type_name;
```

Declare an INDEX BY table to store the last names of employees.

```
...
TYPE ename_table_type IS TABLE OF
employees.last_name%TYPE
INDEX BY PLS_INTEGER;
...
ename_table ename_table_type;
```

ORACLE®

6-16

Copyright © 2004, Oracle. All rights reserved.

Creating an INDEX BY Table

There are two steps involved in creating an INDEX BY table.

1. Declare a TABLE data type.
2. Declare a variable of that data type.

In the syntax:

type_name Is the name of the TABLE type (It is a type specifier used in subsequent declarations of PL/SQL table identifiers.)

column_type Is any scalar or composite data type such as VARCHAR2, DATE, NUMBER or %TYPE (You can use the %TYPE attribute to provide the column data type.)

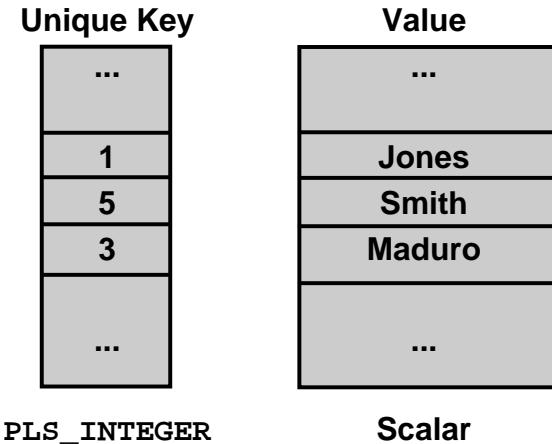

identifier Is the name of the identifier that represents an entire PL/SQL table

Creating an INDEX BY Table (continued)

The NOT NULL constraint prevents nulls from being assigned to the PL/SQL table of that type. Do not initialize the INDEX BY table.

INDEX BY tables can have the following element types: BINARY_INTEGER, BOOLEAN, LONG, LONG RAW, NATURAL, NATURALN, PLS_INTEGER, POSITIVE, POSITIVEN, SIGNTYPE, and STRING. INDEX BY tables are not automatically populated when you create them. You must programmatically populate the INDEX BY tables in your PL/SQL programs and then use them.

INDEX BY Table Structure

ORACLE®

INDEX BY Table Structure

Like the size of a database table, the size of an INDEX BY table is unconstrained. That is, the number of rows in an INDEX BY table can increase dynamically, so that your INDEX BY table grows as new rows are added.

INDEX BY tables can have one column and a unique identifier to that one column, neither of which can be named. The column can belong to any scalar or record data type, but the primary key must belong to the type `PLS_INTEGER` or `BINARY_INTEGER`. You cannot initialize an INDEX BY table in its declaration. An INDEX BY table is not populated at the time of declaration. It contains no keys or values. An explicit executable statement is required to populate the INDEX BY table.

Creating an INDEX BY Table

```
DECLARE
    TYPE ename_table_type IS TABLE OF
        employees.last_name%TYPE
        INDEX BY PLS_INTEGER;
    TYPE hiredate_table_type IS TABLE OF DATE
        INDEX BY PLS_INTEGER;
    ename_table      ename_table_type;
    hiredate_table   hiredate_table_type;
BEGIN
    ename_table(1)      := 'CAMERON';
    hiredate_table(8)   := SYSDATE + 7;
    IF ename_table.EXISTS(1) THEN
        INSERT INTO ...
        ...
    END;
/

```

ORACLE®

6-19

Copyright © 2004, Oracle. All rights reserved.

Creating an INDEX BY Table

The example in the slide creates two INDEX BY tables.

Use the key of the INDEX BY table to access an element in the INDEX BY table.

Syntax:

```
INDEX_BY_table_name(index)
```

where:

index Belongs to type PLS_INTEGER

The example below shows how to reference the third row in an INDEX BY table called *ename_table*:

```
ename_table(3)
```

The magnitude range of a PLS_INTEGER is -2147483647 ... 2147483647, so the primary key value can be negative. Indexing does not need to start with 1.

Note: The `exists(i)` method returns TRUE if a row with index *i* is returned. Use the `exists` method to prevent an error that is raised in reference to a nonexistent table element.

Using INDEX BY Table Methods

The following methods make INDEX BY tables easier to use:

- EXISTS
- COUNT
- FIRST and LAST
- PRIOR
- NEXT
- TRIM
- DELETE

ORACLE®

6-20

Copyright © 2004, Oracle. All rights reserved.

Using INDEX BY Table Methods

An INDEX BY table method is a built-in procedure or function that operates on a PL/SQL table and is called by using a dot notation.

Syntax: *table_name.method_name[(parameters)]*

Method	Description
EXISTS(<i>n</i>)	Returns TRUE if the <i>n</i> th element in a PL/SQL table exists
COUNT	Returns the number of elements that a PL/SQL table currently contains
FIRST LAST	Returns the first and last (smallest and largest) index numbers in a PL/SQL table. Returns NULL if the PL/SQL table is empty
PRIOR(<i>n</i>)	Returns the index number that precedes index <i>n</i> in a PL/SQL table
NEXT(<i>n</i>)	Returns the index number that succeeds index <i>n</i> in a PL/SQL table
TRIM	TRIM removes one element from the end of a PL/SQL table. TRIM(<i>n</i>) removes <i>n</i> elements from the end of a PL/SQL table
DELETE	DELETE removes all elements from a PL/SQL table. DELETE(<i>n</i>) removes the <i>n</i> th element from a PL/SQL table. DELETE(<i>m</i> , <i>n</i>) removes all elements in the range <i>m</i> ... <i>n</i> from a PL/SQL table.

INDEX BY Table of Records

Define an INDEX BY table variable to hold an entire row from a table.

Example:

```
DECLARE
    TYPE dept_table_type IS TABLE OF
        departments%ROWTYPE
        INDEX BY PLS_INTEGER;
    dept_table dept_table_type;
    -- Each element of dept_table is a record
```

ORACLE®

6-21

Copyright © 2004, Oracle. All rights reserved.

INDEX BY Table of Records

At any given point in time, an INDEX BY table declared as a table of scalar datatype can store the details of only one column in a database table. There is often a need to store all the columns retrieved by a query. The INDEX BY table of records offers a solution to this. Because only one table definition is needed to hold information about all the fields of a database table, the table of records greatly increases the functionality of INDEX BY tables.

Referencing a Table of Records

In the example given in the slide, you can refer to fields in the dept_table record because each element of this table is a record.

Syntax:

```
table(index).field
```

Example:

```
dept_table(15).location_id := 1700;
```

location_id represents a field in dept_table.

Referencing a Table of Records (continued)

You can use the %ROWTYPE attribute to declare a record that represents a row in a database table. The differences between the %ROWTYPE attribute and the composite data type PL/SQL record are:

- PL/SQL record types can be user-defined whereas %ROWTYPE implicitly defines the record.
- PL/SQL records allow you to specify the fields and their data types while declaring them. When you use %ROWTYPE, you cannot specify the fields. The %ROWTYPE attribute represents a table row with all the fields based on the definition of that table.
- User-defined records are static, %ROWTYPE records are dynamic as the table structures are altered in the database.

Example of INDEX BY Table of Records

```
SET SERVEROUTPUT ON
DECLARE
    TYPE emp_table_type IS TABLE OF
        employees%ROWTYPE INDEX BY PLS_INTEGER;
    my_emp_table  emp_table_type;
    max_count      NUMBER(3):= 104;
BEGIN
    FOR i IN 100..max_count
    LOOP
        SELECT * INTO my_emp_table(i) FROM employees
        WHERE employee_id = i;
    END LOOP;
    FOR i IN my_emp_table.FIRST..my_emp_table.LAST
    LOOP
        DBMS_OUTPUT.PUT_LINE(my_emp_table(i).last_name);
    END LOOP;
END;
/
```

ORACLE®

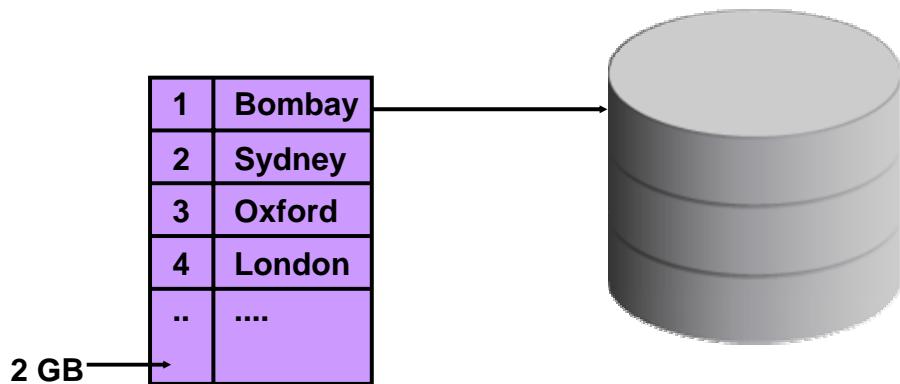

6-23

Copyright © 2004, Oracle. All rights reserved.

Example of INDEX BY Table of Records

The example in the slide declares an INDEX BY table of records `emp_table_type` to temporarily store the details of the employees whose employee IDs lie between 100 and 104. Using a loop, the information of the employees from the `EMPLOYEES` table is retrieved and stored in the INDEX BY table. Another loop is used to print the last names from the INDEX BY table. Observe the use of the `first` and `last` methods in the example.

Nested Tables

ORACLE®

6-24

Copyright © 2004, Oracle. All rights reserved.

Nested Tables

The functionality of nested tables is similar to INDEX BY tables; however, there are differences in the nested table implementation. The nested table is a valid datatype in a schema-level table but an INDEX BY table is not. The key type for nested tables is not PLS_INTEGER. The key cannot be a negative value unlike in the INDEX BY table. Though we are referring to the first column as key, there is no key in case of nested tables. There is a column with numbers in sequence which is considered as the key column. Elements can be deleted from anywhere in a nested table leaving a sparse table with nonsequential keys. The rows of a nested table are not in any particular order. When you retrieve values from a nested table, the rows are given consecutive subscripts starting from 1. Nested tables can be stored in the database unlike INDEX BY tables.

Syntax:

```
TYPE type_name IS TABLE OF
  {column_type | variable%TYPE
  | table.column%TYPE} [NOT NULL]
  | table.%ROWTYPE
```

In Oracle Database 10g, nested tables can be compared for equality. You can check if an element exists in the nested table and also if the nested table is a subset of another.

Nested Tables (continued)

Example:

```
TYPE location_type IS TABLE OF locations.city%TYPE;
offices location_type;
```

If you do not initialize an INDEX BY table, then it is empty. If you do not initialize a nested table, then it is automatically initialized to NULL. You can initialize the offices nested table by using a constructor as shown below:

```
offices := location_type('Bombay',
'Tokyo', 'Singapore', 'Oxford');
```

Complete example:

```
SET SERVEROUTPUT ON
DECLARE
    TYPE location_type IS TABLE OF
locations.city%TYPE;
    offices location_type;
    table_count NUMBER;
BEGIN
    offices := location_type('Bombay',
'Tokyo', 'Singapore',
'Oxford');
    table_count := offices.count();
    FOR i in 1..table_count LOOP
        DBMS_OUTPUT.PUT_LINE(offices(i));
    END LOOP;
```

Bombay

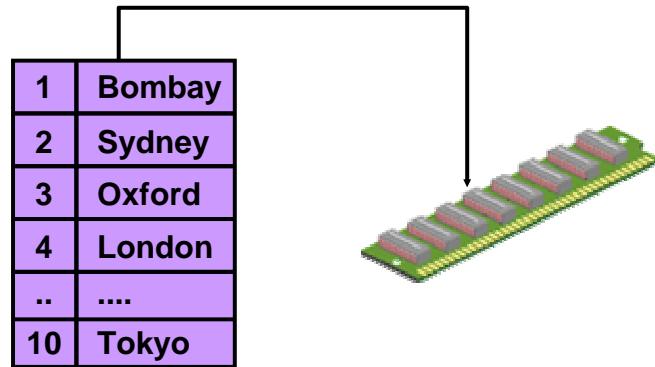

Tokyo

Singapore

Oxford

PL/SQL procedure successfully completed.

VARRAY

ORACLE®

6-26

Copyright © 2004, Oracle. All rights reserved.

VARRAY

Variable-size arrays (VARRAY) are similar to PL/SQL tables except that a VARRAY is constrained in size. VARRAY is valid in a schema-level table. Items of VARRAY type are called VARRAYS. VARRAYS have a fixed upper bound. You have to specify the upper bound when you are declaring them. This is similar to arrays in the C language. The maximum size of a VARRAY is 2 gigabytes (GB) as in nested tables. The distinction between nested table and VARRAY is the physical storage mode. The elements of a VARRAY are stored contiguously in memory and not in the database. One can create a VARRAY type in the database by using SQL.

Example:

```
TYPE location_type IS VARRAY(3) OF locations.city%TYPE;  
offices location_type;
```

The size of a VARRAY is restricted to 3. You can initialize a VARRAY by using constructors. If you try to initialize the VARRAY with more than three elements, then a “Subscript outside of limit” error message is displayed.

Summary

In this lesson, you should have learned how to:

- Define and reference PL/SQL variables of composite data types:
 - PL/SQL records
 - INDEX BY tables
 - INDEX BY table of records
- Define a PL/SQL record by using the %ROWTYPE attribute

ORACLE®

6-27

Copyright © 2004, Oracle. All rights reserved.

Summary

A PL/SQL record is a collection of individual fields that represent a tuple. By using records you can group the data into one structure and then manipulate this structure as one entity or logical unit. This helps reduce coding, and keeps the code easier to maintain and understand.

Like PL/SQL records, the table is another composite data type. INDEX BY tables are objects of TABLE type and look similar to database tables but with a slight difference. INDEX BY tables use a primary key to give you array-like access to rows. The size of an INDEX BY table is unconstrained. INDEX BY tables store a key and a value pair. The key column must be of the PLS_INTEGER or BINARY_INTEGER type and the column that holds the value can be of any data type.

The key type for nested tables is not PLS_INTEGER. The key cannot have a negative value unlike in an INDEX BY table. Also, the key has to be in a sequence.

Variable-size arrays (VARARRAYs) are similar to PL/SQL tables except that a VARARRAY is constrained in size.

Practice 6: Overview

This practice covers the following topics:

- Declaring INDEX BY tables
- Processing data by using INDEX BY tables
- Declaring a PL/SQL record
- Processing data by using a PL/SQL record

Practice 6: Overview

In this practice, you define, create, and use INDEX BY tables and a PL/SQL record.

Practice 6

1. Write a PL/SQL block to print information about a given country.
 - a. Declare a PL/SQL record based on the structure of the `countries` table.
 - b. Use the `DEFINE` command to define a variable `countryid`. Assign CA to `countryid`. Pass the value to the PL/SQL block through an *i*SQL*Plus substitution variable.
 - c. In the declarative section, use the `%ROWTYPE` attribute and declare the variable `country_record` of type `countries`.
 - d. In the executable section, get all the information from the `countries` table by using `countryid`. Display selected information about the country. A sample output is shown below.

```
Country Id: CA Country Name: Canada Region: 2
PL/SQL procedure successfully completed.
```

- e. You may want to execute and test the PL/SQL block for the countries with the IDs DE, UK, US.
2. Create a PL/SQL block to retrieve the name of some departments from the `departments` table and print each department name on the screen, incorporating an INDEX BY table. Save the script as `lab_06_02_soln.sql`.
 - a. Declare an INDEX BY table `dept_table_type` of type `departments.department_name`. Declare a variable `my_dept_table` of type `dept_table_type` to temporarily store the name of the departments.
 - b. Declare two variables: `loop_count` and `deptno` of type NUMBER. Assign 10 to `loop_count` and 0 to `deptno`.
 - c. Using a loop, retrieve the name of 10 departments and store the names in the INDEX BY table. Start with `department_id` 10. Increase `deptno` by 10 for every iteration of the loop. The following table shows the `department_id` for which you should retrieve the `department_name` and store in the INDEX BY table.

Practice 6 (continued)

DEPARTMENT_ID	DEPARTMENT_NAME
10	Administration
20	Marketing
30	Purchasing
40	Human Resources
50	Shipping
60	IT
70	Public Relations
80	Sales
90	Executive
100	Finance

- d. Using another loop, retrieve the department names from the INDEX BY table and display them.
- e. Execute and save your script as lab_06_02_soln.sql. The output is shown below.

```
Administration
Marketing
Purchasing
Human Resources
Shipping
IT
Public Relations
Sales
Executive
Finance
PL/SQL procedure successfully completed.
```

Practice 6 (continued)

3. Modify the block that you created in question 2 to retrieve all information about each department from the departments table and display the information. Use an INDEX BY table of records.
 - a. Load the script lab_06_02_soln.sql.
 - b. You have declared the INDEX BY table to be of type departments.department_name. Modify the declaration of the INDEX BY table, to temporarily store the number, name, and location of the departments. Use the %ROWTYPE attribute.
 - c. Modify the select statement to retrieve all department information currently in the departments table and store it in the INDEX BY table.
 - d. Using another loop, retrieve the department information from the INDEX BY table and display the information. A sample output is shown below.

Department Number: 10 Department Name: Administration Manager
Id: 200 Location Id: 1700

Department Number: 20 Department Name: Marketing Manager Id:
201 Location Id: 1800

Department Number: 30 Department Name: Purchasing Manager Id:
114 Location Id: 1700

Department Number: 40 Department Name: Human Resources
Manager Id: 203 Location Id: 2400

Department Number: 50 Department Name: Shipping Manager Id:
121 Location Id: 1500

Department Number: 60 Department Name: IT Manager Id: 103
Location Id: 1400

Department Number: 70 Department Name: Public Relations
Manager Id: 204 Location Id: 2700

Department Number: 80 Department Name: Sales Manager Id: 145
Location Id: 2500

Department Number: 90 Department Name: Executive Manager Id:
100 Location Id: 1700

Department Number: 100 Department Name: Finance Manager Id:
108 Location Id: 1700

PL/SQL procedure successfully completed.

Practice 6 (continued)

4. Load the script lab_05_03_soln.sql.
 - a. Look for the comment “DECLARE AN INDEX BY TABLE OF TYPE VARCHAR2(50). CALL IT ename_table_type” and include the declaration.
 - b. Look for the comment “DECLARE A VARIABLE ename_table OF TYPE ename_table_type” and include the declaration.
 - c. Save your script as lab_06_04_soln.sql.

Using Explicit Cursors

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- **Distinguish between an implicit and an explicit cursor**
- **Discuss when and why to use an explicit cursor**
- **Declare and control explicit cursors**
- **Use simple loop and cursor FOR loop to fetch data**
- **Declare and use cursors with parameters**
- **Lock rows using the FOR UPDATE clause**
- **Reference the current row with the WHERE CURRENT clause**

ORACLE®

7-2

Copyright © 2004, Oracle. All rights reserved.

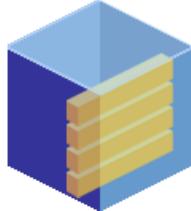

Lesson Aim

You have learned about implicit cursors that are automatically created by PL/SQL when you execute a SQL SELECT or DML statement. In this lesson, you learn about explicit cursors. You will be able to differentiate between implicit and explicit cursors. You learn to declare and control simple cursors and cursors with parameters.

About Cursors

Every SQL statement executed by the Oracle Server has an individual cursor associated with it:

- **Implicit cursors: Declared and managed by PL/SQL for all DML and PL/SQL SELECT statements**
- **Explicit cursors: Declared and managed by the programmer**

ORACLE®

7-3

Copyright © 2004, Oracle. All rights reserved.

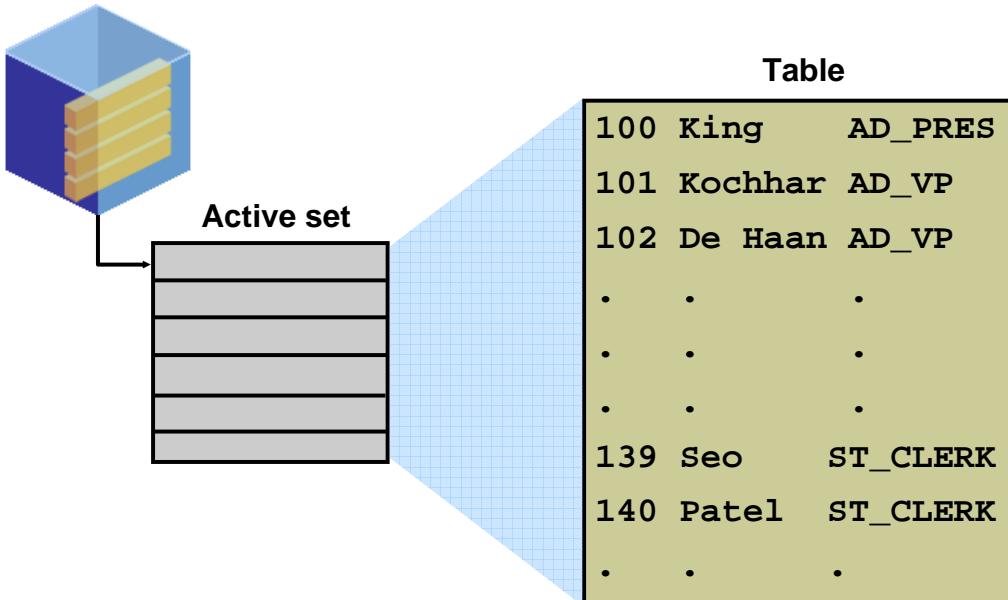

About Cursors

The Oracle server uses work areas, called private SQL areas, to execute SQL statements and to store processing information. You can use explicit cursors to name a private SQL area and access its stored information.

Cursor Type	Description
Implicit	Implicit cursors are declared by PL/SQL implicitly for all DML and PL/SQL SELECT statements.
Explicit	For queries that return more than one row, explicit cursors are declared and managed by the programmer and manipulated through specific statements in the block's executable actions.

The Oracle server implicitly opens a cursor to process each SQL statement not associated with an explicitly declared cursor. Using PL/SQL you can refer to the most recent implicit cursor as the SQL cursor.

Explicit Cursor Operations

Explicit Cursor Operations

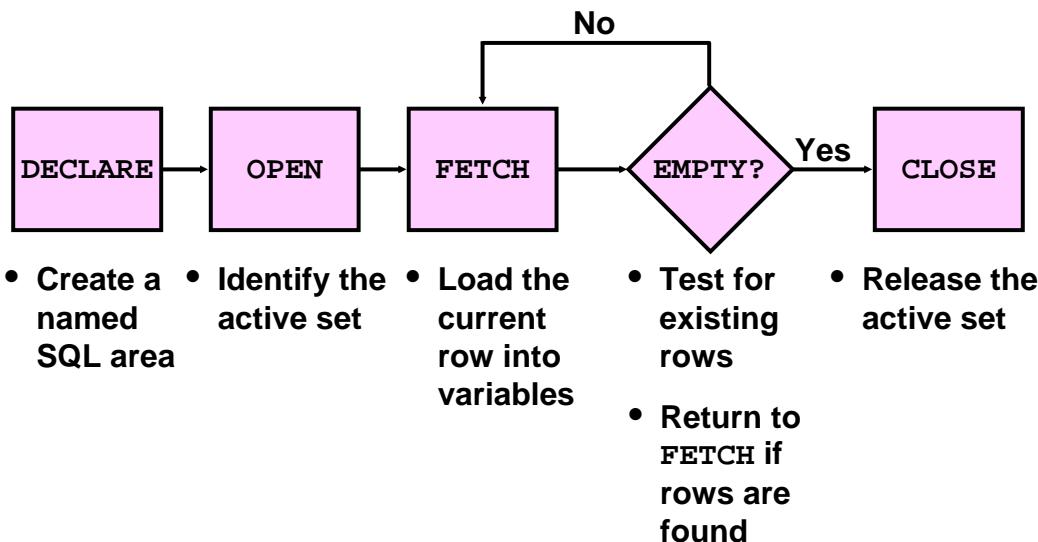

You declare explicit cursors in PL/SQL when you have a SELECT statement returning multiple rows. You can process each row returned by the SELECT statement.

The set of rows returned by a multiple-row query is called the active set. Its size is the number of rows that meet your search criteria. The diagram in the slide shows how an explicit cursor “points” to the current row in the active set. This allows your program to process the rows one at a time.

Explicit cursor functions:

- Can process beyond the first row returned by the query, row by row
- Keep track of which row is currently being processed
- Allow the programmer to manually control explicit cursors in the PL/SQL block

Controlling Explicit Cursors

ORACLE®

Controlling Explicit Cursors

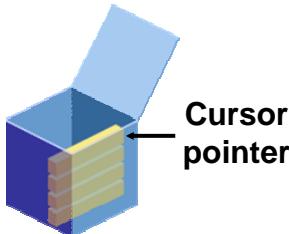

Now that you have a conceptual understanding of cursors, review the steps to use them.

Controlling Explicit Cursors

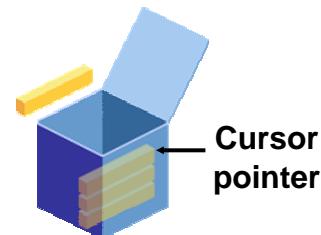

1. Declare the cursor, in the declarative section of a PL/SQL block, by naming it and defining the structure of the query to be associated with it.
2. Open the cursor. The OPEN statement executes the query and binds any variables that are referenced. Rows identified by the query are called the active set and are now available for fetching.
3. Fetch data from the cursor. In the flow diagram shown in the slide, after each fetch you test the cursor for any existing row. If there are no more rows to process, then you must close the cursor.
4. Close the cursor. The CLOSE statement releases the active set of rows. It is now possible to reopen the cursor to establish a fresh active set.

Controlling Explicit Cursors

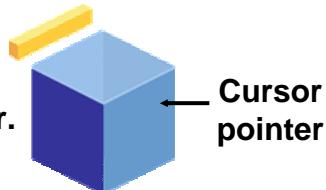

- 1 Open the cursor.

- 2 Fetch a row.

- 3 Close the cursor.

ORACLE®

Controlling Explicit Cursors (continued)

A PL/SQL program opens a cursor, processes rows returned by a query, and then closes the cursor. The cursor marks the current position in the active set.

1. The OPEN statement executes the query associated with the cursor, identifies the active set, and positions the cursor to the first row.
2. The FETCH statement retrieves the current row and advances the cursor to the next row until either there are no more rows or until a specified condition is met.
3. The CLOSE statement releases the cursor.

Declaring the Cursor

Syntax:

```
CURSOR cursor_name IS  
    select_statement;
```

Examples:

```
DECLARE  
    CURSOR emp_cursor IS  
        SELECT employee_id, last_name FROM employees  
        WHERE department_id = 30;
```

```
DECLARE  
    locid NUMBER:= 1700;  
    CURSOR dept_cursor IS  
        SELECT * FROM departments  
        WHERE location_id = locid;  
    ...
```

ORACLE®

7-7

Copyright © 2004, Oracle. All rights reserved.

Declaring the Cursor

The syntax to declare a cursor is shown in the slide.

In the syntax:

cursor_name Is a PL/SQL identifier

select_statement Is a SELECT statement without an INTO clause

The active set of a cursor is determined by the SELECT statement in the cursor declaration. It is mandatory to have an INTO clause for a SELECT statement in PL/SQL. However, note that the SELECT statement in the cursor declaration cannot have an INTO clause. That is because you are only defining a cursor in the declarative section and not retrieving any rows into the cursor.

Note

- Do not include the INTO clause in the cursor declaration because it appears later in the FETCH statement.
- If processing rows in a specific sequence is required, use the ORDER BY clause in the query.
- The cursor can be any valid ANSI SELECT statement, including joins, subqueries, and so on.

Declaring the Cursor (continued)

The cursor `emp_cursor` is declared to retrieve the `employee_id` and `last_name` columns of the employees working in the department with a `department_id` of 30. The cursor `dept_cursor` is declared to retrieve all the details for the department with the `location_id` 1700. Note that a variable is used while declaring the cursor. These variables are considered bind variables. These variables must be visible when you are declaring the cursor. These variables are examined only once at the time the cursor opens. You have learned that explicit cursors are used when you have to retrieve and operate on multiple rows in PL/SQL. However, this example shows you that you can use the explicit cursor even if your `SELECT` statement returns one row.

Opening the Cursor

```
DECLARE
    CURSOR emp_cursor IS
        SELECT employee_id, last_name FROM employees
        WHERE department_id =30;
    ...
BEGIN
    OPEN emp_cursor;
```

ORACLE®

7-9

Copyright © 2004, Oracle. All rights reserved.

Opening the Cursor

The OPEN statement executes the query associated with the cursor, identifies the active set, and positions the cursor pointer to the first row. The OPEN statement is included in the executable section of the PL/SQL block.

OPEN is an executable statement that performs the following operations:

1. Dynamically allocates memory for a context area
2. Parses the SELECT statement
3. Binds the input variables—sets the values for the input variables by obtaining their memory addresses
4. Identifies the active set—the set of rows that satisfy the search criteria. Rows in the active set are not retrieved into variables when the OPEN statement is executed.
Rather, the FETCH statement retrieves the rows from the cursor into the variables.
5. Positions the pointer to the first row in the active set.

Note: If the query returns no rows when the cursor is opened, PL/SQL does not raise an exception. However, you can test the status of the implicit cursor after a fetch using the SQL%ROWCOUNT cursor attribute. For explicit cursors, use <cursor_name>%ROWCOUNT.

Fetching Data from the Cursor

```
SET SERVEROUTPUT ON
DECLARE
    CURSOR emp_cursor IS
        SELECT employee_id, last_name FROM employees
        WHERE department_id =30;
        empno employees.employee_id%TYPE;
        lname employees.last_name%TYPE;
BEGIN
    OPEN emp_cursor;
    FETCH emp_cursor INTO empno, lname;
    DBMS_OUTPUT.PUT_LINE( empno || ' '||lname);
    ...
END;
/
```

ORACLE®

7-10

Copyright © 2004, Oracle. All rights reserved.

Fetching Data from the Cursor

The `FETCH` statement retrieves the rows from the cursor one at a time. After each fetch, the cursor advances to the next row in the active set. You can use the `%NOTFOUND` attribute, to check if the entire active set has been retrieved.

Consider the example shown in the slide. Two variables, `empno` and `lname`, are declared to hold the fetched values from the cursor. Observe the `FETCH` statement.

The output of the PL/SQL block is shown below.

```
114 Raphaely
PL/SQL procedure successfully completed.
```

You have successfully fetched the values from the cursor into the variables. However, there are six employees in department 30. Only one row has been fetched. To fetch all the rows, you have to make use of loops. You will see how a loop is used to fetch all the rows in the next slide.

The `FETCH` statement performs the following operations:

1. Reads the data for the current row into the output PL/SQL variables.
2. Advances the pointer to the next row in the active set.

Fetching Data from the Cursor (continued)

- Include the same number of variables in the INTO clause of the FETCH statement as columns in the SELECT statement, and be sure that the data types are compatible.
- Match each variable to correspond to the columns positionally.
- Alternatively, define a record for the cursor and reference the record in the FETCH INTO clause.
- Test to see whether the cursor contains rows. If a fetch acquires no values, there are no rows left to process in the active set and no error is recorded.

Fetching Data from the Cursor

```
SET SERVEROUTPUT ON
DECLARE
    CURSOR emp_cursor IS
        SELECT employee_id, last_name FROM employees
        WHERE department_id =30;
        empno employees.employee_id%TYPE;
        lname employees.last_name%TYPE;
BEGIN
    OPEN emp_cursor;
    LOOP
        FETCH emp_cursor INTO empno, lname;
        EXIT WHEN emp_cursor%NOTFOUND;
        DBMS_OUTPUT.PUT_LINE( empno || ' ' || lname);
    END LOOP;
    ...
END;
/
```

ORACLE

7-12

Copyright © 2004, Oracle. All rights reserved.

Fetching Data from the Cursor (continued)

Observe that a simple LOOP is used to fetch all the rows. Also, the cursor attribute %NOTFOUND is used to test for the exit condition. The output of the PL/SQL block is shown below:

```
114 Raphaely
115 Khoo
116 Baida
117 Tobias
118 Himuro
119 Colmenares
PL/SQL procedure successfully completed.
```

Closing the Cursor

```
...
LOOP
  FETCH emp_cursor INTO empno, lname;
  EXIT WHEN emp_cursor%NOTFOUND;
  DBMS_OUTPUT.PUT_LINE( empno || ' ' || lname);
END LOOP;
CLOSE emp_cursor;
END;
/
```

ORACLE®

7-13

Copyright © 2004, Oracle. All rights reserved.

Closing the Cursor

The CLOSE statement disables the cursor, releases the context area, and undefines the active set. Close the cursor after completing the processing of the FETCH statement. You can reopen the cursor if required. A cursor can be reopened only if it is closed. If you attempt to fetch data from a cursor after it has been closed, then an INVALID_CURSOR exception will be raised.

Note: Although it is possible to terminate the PL/SQL block without closing cursors, you should make it a habit to close any cursor that you declare explicitly to free up resources. There is a maximum limit on the number of open cursors per session, which is determined by the OPEN_CURSORS parameter in the database parameter file. OPEN_CURSORS = 50 by default.

Cursors and Records

Process the rows of the active set by fetching values into a PL/SQL RECORD.

```
DECLARE
  CURSOR emp_cursor IS
    SELECT employee_id, last_name FROM employees
    WHERE department_id =30;
    emp_record emp_cursor%ROWTYPE;
BEGIN
  OPEN emp_cursor;
  LOOP
    FETCH emp_cursor INTO emp_record;
    ...
  END LOOP;
END;
```

ORACLE®

7-14

Copyright © 2004, Oracle. All rights reserved.

Cursors and Records

You have already seen that you can define records that have the structure of columns in a table. You can also define a record based on the selected list of columns in an explicit cursor. This is convenient for processing the rows of the active set, because you can simply fetch into the record. Therefore, the values of the row are loaded directly into the corresponding fields of the record.

Cursor FOR Loops

Syntax:

```
FOR record_name IN cursor_name LOOP
    statement1;
    statement2;
    . . .
END LOOP;
```

- **The cursor FOR loop is a shortcut to process explicit cursors.**
- **Implicit open, fetch, exit, and close occur.**
- **The record is implicitly declared.**

Cursor FOR Loops

You have learned to fetch data from cursors by using simple loops. You will now learn to use a cursor FOR loop. A cursor FOR loop processes rows in an explicit cursor. It is a shortcut because the cursor is opened, a row is fetched once for each iteration in the loop, the loop exits when the last row is processed, and the cursor is closed automatically. The loop itself is terminated automatically at the end of the iteration where the last row is fetched.

In the syntax:

<i>record_name</i>	Is the name of the implicitly declared record
<i>cursor_name</i>	Is a PL/SQL identifier for the previously declared cursor

Guidelines

- Do not declare the record that controls the loop because it is declared implicitly.
- Test the cursor attributes during the loop, if required.
- Supply the parameters for a cursor, if required, in parentheses following the cursor name in the FOR statement.

Cursor FOR Loops

```
SET SERVEROUTPUT ON
DECLARE
  CURSOR emp_cursor IS
    SELECT employee_id, last_name FROM employees
    WHERE department_id =30;
BEGIN
  FOR emp_record IN emp_cursor
  LOOP
    DBMS_OUTPUT.PUT_LINE( emp_record.employee_id
    || ' ' || emp_record.last_name);
  END LOOP;
END;
/
```

ORACLE®

7-16

Copyright © 2004, Oracle. All rights reserved.

Cursor FOR Loops (continued)

The example that was used to demonstrate the usage of a simple loop to fetch data from cursors is rewritten to use the cursor FOR loop.

The `emp_record` is the record that is implicitly declared. You can access the fetched data with this implicit record as shown in the slide. Observe that no variables are declared to hold the fetched data using the `INTO` clause. The code does not have `OPEN` and `CLOSE` statements to open and close the cursor respectively.

Explicit Cursor Attributes

Obtain status information about a cursor.

Attribute	Type	Description
%ISOPEN	Boolean	Evaluates to TRUE if the cursor is open
%NOTFOUND	Boolean	Evaluates to TRUE if the most recent fetch does not return a row
%FOUND	Boolean	Evaluates to TRUE if the most recent fetch returns a row; complement of %NOTFOUND
%ROWCOUNT	Number	Evaluates to the total number of rows returned so far

ORACLE®

7-17

Copyright © 2004, Oracle. All rights reserved.

Explicit Cursor Attributes

As with implicit cursors, there are four attributes for obtaining status information about a cursor. When appended to the cursor variable name, these attributes return useful information about the execution of a cursor manipulation statement.

Note: You cannot reference cursor attributes directly in a SQL statement.

The %ISOPEN Attribute

- Fetch rows only when the cursor is open.
- Use the %ISOPEN cursor attribute before performing a fetch to test whether the cursor is open.

Example:

```
IF NOT emp_cursor%ISOPEN THEN
    OPEN emp_cursor;
END IF;
LOOP
    FETCH emp_cursor...
```

ORACLE®

7-18

Copyright © 2004, Oracle. All rights reserved.

The %ISOPEN Attribute

- You can fetch rows only when the cursor is open. Use the %ISOPEN cursor attribute to determine whether the cursor is open.
- Fetch rows in a loop. Use cursor attributes to determine when to exit the loop.
- Use the %ROWCOUNT cursor attribute for the following:
 - To process an exact number of rows
 - To fetch the rows in a loop and determine when to exit the loop

Note: %ISOPEN returns the status of the cursor: TRUE if open and FALSE if not.

Example of %ROWCOUNT and %NOTFOUND

```
SET SERVEROUTPUT ON
DECLARE
    empno  employees.employee_id%TYPE;
    ename   employees.last_name%TYPE;
    CURSOR emp_cursor IS SELECT employee_id,
                                last_name FROM employees;
BEGIN
    OPEN emp_cursor;
    LOOP
        FETCH emp_cursor INTO empno, ename;
        EXIT WHEN emp_cursor%ROWCOUNT > 10 OR
               emp_cursor%NOTFOUND;
        DBMS_OUTPUT.PUT_LINE(TO_CHAR(empno)
                             || ' ' || ename);
    END LOOP;
    CLOSE emp_cursor;
END ;
/
```

ORACLE

7-19

Copyright © 2004, Oracle. All rights reserved.

Example of %ROWCOUNT and %NOTFOUND

The example in the slide retrieves the first ten employees one by one. This example shows how %ROWCOUNT and %NOTFOUND attributes can be used for exit conditions in a loop.

Cursor FOR Loops Using Subqueries

No need to declare the cursor.

Example:

```
SET SERVEROUTPUT ON
BEGIN
  FOR emp_record IN (SELECT employee_id, last_name
                      FROM employees WHERE department_id =30)
  LOOP
    DBMS_OUTPUT.PUT_LINE( emp_record.employee_id || '
    ' || emp_record.last_name);
  END LOOP;
END;
/
```

ORACLE®

7-20

Copyright © 2004, Oracle. All rights reserved.

Cursor FOR Loops Using Subqueries

Observe that there is no declarative section in this PL/SQL block. The difference between the cursor FOR loops using subqueries and the cursor FOR loop lies in the cursor declaration. If you are writing cursor FOR loops using subqueries, you need not declare the cursor in the declarative section. You have to provide the SELECT statement that determines the active set in the loop itself.

The example that was used to illustrate a cursor FOR loop is rewritten to illustrate a cursor FOR loop using subqueries.

Note: You cannot reference explicit cursor attributes if you use a subquery in a cursor FOR loop because you cannot give the cursor an explicit name.

Cursors with Parameters

Syntax:

```
CURSOR cursor_name
  [ (parameter_name datatype, ... ) ]
IS
  select_statement;
```

- **Pass parameter values to a cursor when the cursor is opened and the query is executed.**
- **Open an explicit cursor several times with a different active set each time.**

```
OPEN cursor_name(parameter_value,....) ;
```

ORACLE®

7-21

Copyright © 2004, Oracle. All rights reserved.

Cursors with Parameters

You can pass parameters to a cursor in a cursor FOR loop. This means that you can open and close an explicit cursor several times in a block, returning a different active set on each occasion. For each execution, the previous cursor is closed and reopened with a new set of parameters.

Each formal parameter in the cursor declaration must have a corresponding actual parameter in the OPEN statement. Parameter data types are the same as those for scalar variables, but you do not give them sizes. The parameter names are for references in the query expression of the cursor.

In the syntax:

<i>cursor_name</i>	Is a PL/SQL identifier for the declared cursor
<i>parameter_name</i>	Is the name of a parameter
<i>datatype</i>	Is the scalar data type of the parameter
<i>select_statement</i>	Is a SELECT statement without the INTO clause

The parameter notation does not offer greater functionality; it simply allows you to specify input values easily and clearly. This is particularly useful when the same cursor is referenced repeatedly.

Cursors with Parameters

```
SET SERVEROUTPUT ON
DECLARE
    CURSOR emp_cursor (deptno NUMBER) IS
        SELECT employee_id, last_name
        FROM employees
        WHERE department_id = deptno;
        dept_id NUMBER;
        lname VARCHAR2(15);
BEGIN
    OPEN emp_cursor (10);
    ...
    CLOSE emp_cursor;
    OPEN emp_cursor (20);
    ...

```

Cursors with Parameters (continued)

Parameter data types are the same as those for scalar variables, but you do not give them sizes. The parameter names are for reference in the cursor's query. In the following example, a cursor is declared and is defined with one parameter.

```
DECLARE
    CURSOR emp_cursor(deptno NUMBER) IS SELECT ...
```

The following statements open the cursor and return different active sets:

```
OPEN emp_cursor(10);
OPEN emp_cursor(20);
```

You can pass parameters to the cursor used in a cursor FOR loop:

```
DECLARE
    CURSOR emp_cursor(p_deptno NUMBER, p_job VARCHAR2) IS
        SELECT ...
BEGIN
    FOR emp_record IN emp_cursor(10, 'Sales') LOOP ...
```

The FOR UPDATE Clause

Syntax:

```
SELECT ...
  FROM ...
FOR UPDATE [OF column_reference][NOWAIT | WAIT n];
```

- **Use explicit locking to deny access to other sessions for the duration of a transaction.**
- **Lock the rows before the update or delete.**

ORACLE®

7-23

Copyright © 2004, Oracle. All rights reserved.

The FOR UPDATE Clause

If there are multiple sessions for a single database, there is the possibility that the rows of a particular table were updated after you opened your cursor. You will see the updated data only when you reopen the cursor. Therefore, it is better to have locks on the rows before you update or delete rows. You can lock the rows with the FOR UPDATE clause in the cursor query.

In the syntax:

column_reference Is a column in the table against which the query is performed (A list of columns may also be used.)

NOWAIT Returns an Oracle server error if the rows are locked by another session.

The FOR UPDATE clause is the last clause in a select statement, even after the ORDER BY, if one exists. When querying multiple tables, you can use the FOR UPDATE clause to confine row locking to particular tables. FOR UPDATE OF *col_name(s)* locks rows only in tables that contain the *col_name(s)*.

The FOR UPDATE Clause (continued)

The SELECT . . . FOR UPDATE statement identifies the rows that will be updated or deleted, then locks each row in the result set. This is useful when you want to base an update on the existing values in a row. In that case, you must make sure that the row is not changed by another session before the update.

The optional NOWAIT keyword tells the Oracle server not to wait if requested rows have been locked by another user. Control is immediately returned to your program so that it can do other work before trying again to acquire the lock. If you omit the NOWAIT keyword, the Oracle server waits until the rows are available.

Example:

```
DECLARE
    CURSOR emp_cursor IS
        SELECT employee_id, last_name, FROM employees
        WHERE department_id = 80 FOR UPDATE OF salary
        NOWAIT;
    ...

```

If the Oracle server cannot acquire the locks on the rows it needs in a SELECT FOR UPDATE, it waits indefinitely. Use NOWAIT to handle such situations. If the rows are locked by another session and you have specified NOWAIT, then opening the cursor will result in an error. You can try to open the cursor later. You can use WAIT instead of NOWAIT and specify the number of seconds to wait and check if the rows are unlocked. If the rows are still locked after *n* seconds, then an error is returned.

It is not mandatory that the FOR UPDATE OF clause refers to a column, but it is recommended for better readability and maintenance.

The WHERE CURRENT OF Clause

Syntax:

```
WHERE CURRENT OF cursor ;
```

- Use cursors to update or delete the current row.
- Include the FOR UPDATE clause in the cursor query to lock the rows first.
- Use the WHERE CURRENT OF clause to reference the current row from an explicit cursor.

```
UPDATE employees  
      SET salary = ...  
 WHERE CURRENT OF emp_cursor;
```

ORACLE®

7-25

Copyright © 2004, Oracle. All rights reserved.

The WHERE CURRENT OF Clause

The WHERE CURRENT OF clause is used in conjunction with the FOR UPDATE clause to refer to the current row in an explicit cursor. The WHERE CURRENT OF clause is used in the UPDATE or DELETE statement whereas the FOR UPDATE clause is specified in the cursor declaration. You can use the combination for updating or deleting the current row from the corresponding database table. This allows you to apply updates and deletes to the row currently being addressed, without the need to explicitly reference the ROWID. You must include the FOR UPDATE clause in the cursor query so that the rows are locked on OPEN.

In the syntax:

cursor Is the name of a declared cursor (The cursor must have been declared with the FOR UPDATE clause.)

Cursors with Subqueries

Example:

```
DECLARE
  CURSOR my_cursor IS
    SELECT t1.department_id, t1.department_name,
           t2.staff
      FROM departments t1, (SELECT department_id,
                                         COUNT(*) AS STAFF
                                    FROM employees
                                   GROUP BY department_id) t2
     WHERE t1.department_id = t2.department_id
       AND t2.staff >= 3;
...
...
```

Cursors with Subqueries

A subquery is a query (usually enclosed by parentheses) that appears within another SQL statement. When evaluated, the subquery provides a value or set of values to the outer query. Subqueries are often used in the WHERE clause of a select statement. They can also be used in the FROM clause, creating a temporary data source for that query.

In this example, the subquery creates a data source consisting of department numbers and employee head count in each department (known by the alias STAFF). A table alias, t2, refers to this temporary data source in the FROM clause. When this cursor is opened, the active set contains the department number, department name, and total number of employees working for the department, provided there are three or more employees working for the department.

Summary

In this lesson you should have learned how to:

- **Distinguish cursor types:**
 - **Implicit cursors:** Used for all **DML statements and single-row queries**
 - **Explicit cursors:** Used for **queries of zero, one, or more rows**
- **Create and handle explicit cursors**
- **Use simple loops and cursor FOR loops to handle multiple rows in the cursors**
- **Evaluate the cursor status by using the cursor attributes**
- **Use the FOR UPDATE and WHERE CURRENT OF clauses to update or delete the current fetched row**

ORACLE®

7-27

Summary

The Oracle server uses work areas to execute SQL statements and store processing information. You can use a PL/SQL construct called a cursor to name a work area and access its stored information. There are two kinds of cursors: implicit and explicit. PL/SQL implicitly declares a cursor for all SQL data manipulation statements, including queries that return only one row. For queries that return more than one row, you must explicitly declare a cursor to process the rows individually.

Every explicit cursor and cursor variable has four attributes: %FOUND, %ISOPEN, %NOTFOUND, and %ROWCOUNT. When appended to the cursor variable name, these attributes return useful information about the execution of a SQL statement. You can use cursor attributes in procedural statements but not in SQL statements.

Use simple loops or cursor FOR loops to operate on the multiple rows fetched by the cursor. If you are using simple loops, you have to open, fetch, and close the cursor; however, cursor FOR loops do this implicitly. If you are updating or deleting rows, lock the rows by using a FOR UPDATE clause. This ensures that the data you are using is not updated by another session after you have opened the cursor. Use a WHERE CURRENT OF clause in conjunction with the FOR UPDATE clause to reference the current row fetched by the cursor.

Practice 7: Overview

This practice covers the following topics:

- **Declaring and using explicit cursors to query rows of a table**
- **Using a cursor FOR loop**
- **Applying cursor attributes to test the cursor status**
- **Declaring and using cursor with parameters**
- **Using the FOR UPDATE and WHERE CURRENT OF clauses**

ORACLE®

7-28

Copyright © 2004, Oracle. All rights reserved.

Practice 7: Overview

In this practice you apply your knowledge of cursors to process a number of rows from a table and populate another table with the results using a cursor FOR loop. You will also write a cursor with parameters.

Practice 7

1. Create a PL/SQL block that determines the top n salaries of the employees.
 - a. Execute the script `lab_07_01.sql` to create a new table, `top_salaries`, for storing the salaries of the employees.
 - b. Accept a number n from the user where n represents the number of top n earners from the `employees` table. For example, to view the top five salaries, enter 5.

Note: Use the `DEFINE` command to define a variable `p_num` to provide the value for n . Pass the value to the PL/SQL block through an *i*SQL*Plus substitution variable.

 - c. In the declarative section, declare two variables: `num` of type `NUMBER` to accept the substitution variable `p_num`, `sal` of type `employees.salary`. Declare a cursor, `emp_cursor`, that retrieves the salaries of employees in descending order. Remember that the salaries should not be duplicated.
 - d. In the executable section, open the loop and fetch top n salaries and insert them into `top_salaries` table. You can use a simple loop to operate on the data. Also, try and use `%ROWCOUNT` and `%FOUND` attributes for the exit condition.
 - e. After inserting into the `top_salaries` table, display the rows with a `SELECT` statement. The output shown represents the five highest salaries in the `employees` table.

SALARY
24000
17000
14000
13500
13000

- f. Test a variety of special cases, such as $n = 0$ or where n is greater than the number of employees in the `employees` table. Empty the `top_salaries` table after each test.
2. Create a PL/SQL block that does the following:
 - a. Use the `DEFINE` command to define a variable `p_deptno` to provide the department ID.
 - b. In the declarative section, declare a variable `deptno` of type `NUMBER` and assign the value of `p_deptno`.
 - c. Declare a cursor, `emp_cursor`, that retrieves the `last_name`, `salary`, and `manager_id` of the employees working in the department specified in `deptno`.

Practice 7 (continued)

- d. In the executable section use the cursor FOR loop to operate on the data retrieved. If the salary of the employee is less than 5000 and if the manager ID is either 101 or 124, display the message <<last_name>> Due for a raise. Otherwise, display the message <<last_name>> Not due for a raise.
- e. Test the PL/SQL block for the following cases:

Department ID	Message
10	Whalen Due for a raise
20	Hartstein Not Due for a raise Fay Not Due for a raise
50	Weiss Not Due for a raise Fripp Not Due for a raise Kaufling Not Due for a raise Vollman Not Due for a raise Mourgas Not Due for a raise ... Rajs Due for a raise
80	Russel Not Due for a raise Partners Not Due for a raise Errazuriz Not Due for a raise Cambrault Not Due for a raise

Practice 7 (continued)

3. Write a PL/SQL block, which declares and uses cursors with parameters.

In a loop, use a cursor to retrieve the department number and the department name from the `departments` table for a department whose `department_id` is less than 100. Pass the department number to another cursor as a parameter to retrieve from the `employees` table the details of employee last name, job, hire date, and salary of those employees whose `employee_id` is less than 120 and who work in that department.

- a. In the declarative section declare a cursor `dept_cursor` to retrieve `department_id`, `department_name` for those departments with `department_id` less than 100. Order by `department_id`.
- b. Declare another cursor `emp_cursor` that takes the department number as parameter and retrieves `last_name`, `job_id`, `hire_date`, and `salary` of those employees with `employee_id` of less than 120 and who work in that department.
- c. Declare variables to hold the values retrieved from each cursor. Use the `%TYPE` attribute while declaring variables.
- d. Open the `dept_cursor`, use a simple loop and fetch values into the variables declared. Display the department number and department name.
- e. For each department, open the `emp_cursor` by passing the current department number as a parameter. Start another loop and fetch the values of `emp_cursor` into variables and print all the details retrieved from the `employees` table.
Note: You may want to print a line after you have displayed the details of each department. Use appropriate attributes for the exit condition. Also check if a cursor is already open before opening the cursor.
- f. Close all the loops and cursors, and end the executable section. Execute the script.

Practice 7 (continued)

The sample output is shown below.

Department Number : 10 Department Name : Administration

Department Number : 20 Department Name : Marketing

Department Number : 30 Department Name : Purchasing

Raphaely PU_MAN 07-DEC-94 11000

Khoo PU_CLERK 18-MAY-95 3100

Baida PU_CLERK 24-DEC-97 2900

Tobias PU_CLERK 24-JUL-97 2800

Himuro PU_CLERK 15-NOV-98 2600

Colmenares PU_CLERK 10-AUG-99 2500

Department Number : 40 Department Name : Human Resources

Department Number : 50 Department Name : Shipping

Department Number : 60 Department Name : IT

Hunold IT_PROG 03-JAN-90 9000

Ernst IT_PROG 21-MAY-91 6000

Austin IT_PROG 25-JUN-97 4800

Pataballa IT_PROG 05-FEB-98 4800

Lorentz IT_PROG 07-FEB-99 4200

Department Number : 70 Department Name : Public Relations

Department Number : 80 Department Name : Sales

Department Number : 90 Department Name : Executive

King AD_PRES 17-JUN-87 24000

Kochhar AD_VP 21-SEP-89 17000

De Haan AD_VP 13-JAN-93 17000

PL/SQL procedure successfully completed.

Practice 7 (continued)

4. Load the script lab_06_04_soln.sql.
 - a. Look for the comment “DECLARE A CURSOR CALLED emp_records TO HOLD salary, first_name, and last_name of employees” and include the declaration. Create the cursor such that it retrieves the salary, first_name, and last_name of employees in the department specified by the user (substitution variable emp_deptid). Use the FOR UPDATE clause.
 - b. Look for the comment “INCLUDE EXECUTABLE SECTION OF INNER BLOCK HERE” and start the executable block.
 - c. Only employees working in the departments with department_id 20, 60, 80,100, and 110 are eligible for raises this quarter. Check if the user has entered any of these department IDs. If the value does not match, display the message “SORRY, NO SALARY REVISIONS FOR EMPLOYEES IN THIS DEPARTMENT.” If the value matches, then, open the cursor emp_records.
 - d. Start a simple loop and fetch the values into emp_sal, emp_fname, and emp_lname. Use %NOTFOUND for the exit condition.
 - e. Include a CASE expression. Use the following table as reference for the conditions in the WHEN clause of the CASE expression.
Note: In your CASE expression use the constants such as c_range1, c_hike1 which are already declared.

salary	Hike percentage
< 6500	20
> 6500 < 9500	15
> 9500 < 12000	8
> 12000	3

For example, if the salary of the employee is less than 6500, then increase the salary by 20 percent. In every WHEN clause, concatenate the first_name and last_name of the employee and store it in the INDEX BY table. Increment the value in variable i so that you can store the string in the next location. Include an UPDATE statement with the WHERE CURRENT OF clause.

- f. Close the loop. Use the %ROWCOUNT attribute and print the number of records that were modified. Close the cursor.
- g. Include a simple loop to print the names of all the employees whose salaries were revised.
Note: You already have the names of these employees in the INDEX BY table. Look for the comment “CLOSE THE INNER BLOCK” and include an END IF statement and an END statement.
- h. Save your script as lab_07_04_soln.sql.

Handling Exceptions

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- **Define PL/SQL exceptions**
- **Recognize unhandled exceptions**
- **List and use different types of PL/SQL exception handlers**
- **Trap unanticipated errors**
- **Describe the effect of exception propagation in nested blocks**
- **Customize PL/SQL exception messages**

ORACLE®

Lesson Aim

You have learned to write PL/SQL blocks with a declarative section and an executable section. All the SQL and PL/SQL code that has to be executed is written in the executable block. So far we have assumed that the code works fine if we take care of compile time errors. However, the code may cause some unanticipated errors at run time. In this lesson, you learn how to deal with such errors in the PL/SQL block.

Example

```
SET SERVEROUTPUT ON
DECLARE
    lname VARCHAR2(15);
BEGIN
    SELECT last_name INTO lname FROM employees WHERE
        first_name='John';
    DBMS_OUTPUT.PUT_LINE ('John''s last name is : '
        ||lname);
END;
/
```

ORACLE®

8-3

Copyright © 2004, Oracle. All rights reserved.

Example

Consider the simple example shown in the slide. There are no syntax errors in the code, which means you must be able to successfully execute the anonymous block. The select statement in the block is retrieving the last_name of John. You will see the following output when you execute the code.

```
DECLARE
    *
```

ERROR at line 1:

ORA-01422: exact fetch returns more than requested number of rows
ORA-06512: at line 4

Observe that the code does not work as expected. You expected the select statement to retrieve only one row; however, it is retrieving multiple rows. Such errors that occur at run time are called exceptions. When an exception occurs, the PL/SQL block is terminated. You can handle such exceptions in your PL/SQL block.

Example

```
SET SERVEROUTPUT ON
DECLARE
    lname VARCHAR2(15);
BEGIN
    SELECT last_name INTO lname FROM employees WHERE
        first_name='John';
    DBMS_OUTPUT.PUT_LINE ('John''s last name is : '
        || lname);
EXCEPTION
    WHEN TOO_MANY_ROWS THEN
        DBMS_OUTPUT.PUT_LINE (' Your select statement
            retrieved multiple rows. Consider using a
            cursor.');
END;
/
```

ORACLE

Example (continued)

You have written PL/SQL blocks with a declarative section (beginning with the keyword DECLARE) and an executable section (beginning and ending with the keywords BEGIN and END respectively). For exception handling, include another optional section called the exception section. This section begins with the keyword EXCEPTION. If present, this is the last section in a PL/SQL block. Examine the code in the slide to see the EXCEPTION section. You need not pay attention to the syntax and statements within the section. You will learn about them later in the lesson.

The code in the previous slide is rewritten to handle the exception that occurred. The output of this code is shown below:

Your select statement retrieved multiple rows. Consider using a cursor.
PL/SQL procedure successfully completed.

Unlike earlier, the PL/SQL program did not terminate abruptly. When the exception is raised, the control shifts to the exception section and all the statements in the exception section are executed. The PL/SQL block terminates with normal, successful completion.

Handling Exceptions with PL/SQL

- An exception is an error PL/SQL that is raised during program execution.
- An exception can be raised:
 - Implicitly by the Oracle server
 - Explicitly by the program
- An exception can be handled:
 - By trapping it with a handler
 - By propagating it to the calling environment

ORACLE®

8-5

Copyright © 2004, Oracle. All rights reserved.

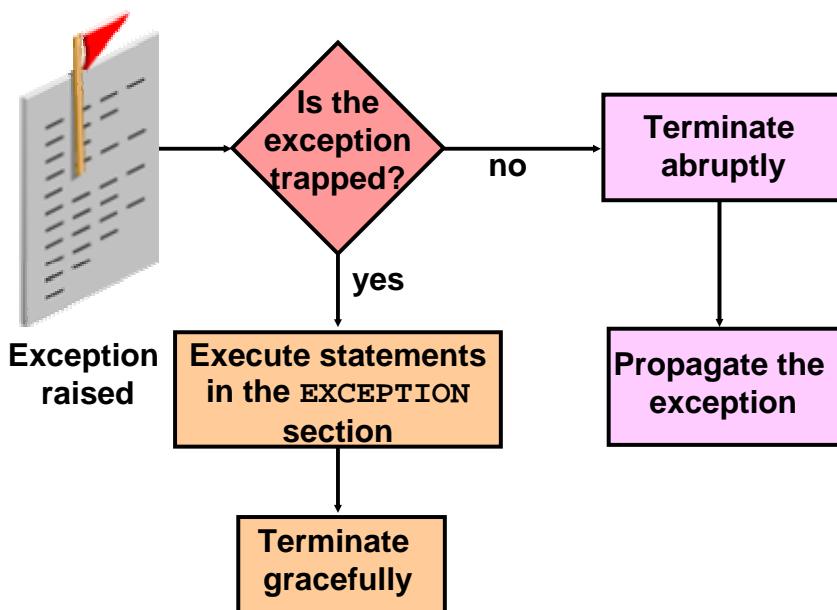

Handling Exceptions with PL/SQL

An exception is an error in PL/SQL that is raised during the execution of a block. A block always terminates when PL/SQL raises an exception, but can you specify an exception handler to perform final actions before the block ends.

Two Methods for Raising an Exception

- An Oracle error occurs and the associated exception is raised automatically. For example, if the error ORA-01403 occurs when no rows are retrieved from the database in a SELECT statement, then PL/SQL raises the exception NO_DATA_FOUND. These errors are converted into predefined exceptions.
- Depending on the business functionality your program is implementing, you may have to explicitly raise an exception. You raise an exception explicitly by issuing the RAISE statement within the block. The exception being raised may be either user-defined or predefined.
- There are some non-predefined Oracle errors. These errors are any standard Oracle errors that are not predefined. You can explicitly declare exceptions and associate them with the non-predefined Oracle errors.

Handling Exceptions

ORACLE®

Handling Exceptions

Trapping an Exception

Include an EXCEPTION section in your PL/SQL program to trap exceptions. If the exception is raised in the executable section of the block, processing branches to the corresponding exception handler in the exception section of the block. If PL/SQL successfully handles the exception, then the exception does not propagate to the enclosing block or to the calling environment. The PL/SQL block terminates successfully.

Propagating an Exception

If the exception is raised in the executable section of the block and there is no corresponding exception handler, the PL/SQL block terminates with failure and the exception is propagated to an enclosing block or to the calling environment. The calling environment can be any application, such as SQL*Plus that is invoking the PL/SQL program.

Exception Types

- Predefined Oracle Server
 - Non-predefined Oracle Server
- } Implicitly raised
-
- User-defined
- Explicitly raised

ORACLE®

8-7

Copyright © 2004, Oracle. All rights reserved.

Exception Types

There are three types of exceptions.

Exception	Description	Directions for Handling
Predefined Oracle Server error	One of approximately 20 errors that occur most often in PL/SQL code	You need not declare these exceptions. They are predefined by the Oracle Server and are raised implicitly.
Non-predefined Oracle Server error	Any other standard Oracle Server error	Declare within the declarative section and allow the Oracle Server to raise them implicitly.
User-defined error	A condition that the developer determines is abnormal	Declare within the declarative section, and raise explicitly.

Note: Some application tools with client-side PL/SQL, such as Oracle Developer Forms, have their own exceptions.

Trapping Exceptions

Syntax:

```
EXCEPTION
  WHEN exception1 [OR exception2 . . .] THEN
    statement1;
    statement2;
    . . .
  [WHEN exception3 [OR exception4 . . .] THEN
    statement1;
    statement2;
    . . .]
  [WHEN OTHERS THEN
    statement1;
    statement2;
    . . .]
```

ORACLE®

8-8

Copyright © 2004, Oracle. All rights reserved.

Trapping Exceptions

You can trap any error by including a corresponding handler within the exception handling section of the PL/SQL block. Each handler consists of a WHEN clause, which specifies an exception name, followed by a sequence of statements to be executed when that exception is raised. You can include any number of handlers within an EXCEPTION section to handle specific exceptions. However, you cannot have multiple handlers for a single exception.

In the syntax:

<i>exception</i>	Is the standard name of a predefined exception or the name of a user-defined exception declared within the declarative section
<i>statement</i>	Is one or more PL/SQL or SQL statements
OTHERS	Is an optional exception-handling clause that traps any exceptions that have not been explicitly handled

Trapping Exceptions (continued)

WHEN OTHERS Exception Handler

The exception-handling section traps only those exceptions that are specified; any other exceptions are not trapped unless you use the OTHERS exception handler. This traps any exception not yet handled. For this reason, OTHERS may be used, and if used it must be the last exception handler that is defined.

```
WHEN NO_DATA_FOUND THEN
    statement1;
    ...
WHEN TOO_MANY_ROWS THEN
    statement1;
    ...
WHEN OTHERS THEN
    statement1;
```

Consider the example given above. If the exception NO_DATA_FOUND is raised by the program, then the statements in the corresponding handler are executed. If the exception TOO_MANY_ROWS is raised, then the statements in the corresponding handler are executed. However, if some other exception is raised, then the statements in the OTHERS exception handler are executed.

The OTHERS handler traps all the exceptions that are not already trapped. Some Oracle tools have their own predefined exceptions that you can raise to cause events in the application. The OTHERS handler also traps these exceptions.

Guidelines for Trapping Exceptions

- The **EXCEPTION** keyword starts the exception handling section.
- Several exception handlers are allowed.
- Only one handler is processed before leaving the block.
- **WHEN OTHERS** is the last clause.

ORACLE®

8-10

Copyright © 2004, Oracle. All rights reserved.

Guidelines for Trapping Exceptions

- Begin the exception-handling section of the block with the **EXCEPTION** keyword.
- Define several exception handlers, each with its own set of actions, for the block.
- When an exception occurs, PL/SQL processes only one handler before leaving the block.
- Place the **OTHERS** clause after all other exception-handling clauses.
- You can have only one **OTHERS** clause.
- Exceptions cannot appear in assignment statements or SQL statements.

Trapping Predefined Oracle Server Errors

- Reference the predefined name in the exception handling routine.
- Sample predefined exceptions:
 - NO_DATA_FOUND
 - TOO_MANY_ROWS
 - INVALID_CURSOR
 - ZERO_DIVIDE
 - DUP_VAL_ON_INDEX

ORACLE®

8-11

Copyright © 2004, Oracle. All rights reserved.

Trapping Predefined Oracle Server Errors

Trap a predefined Oracle Server error by referencing its predefined name within the corresponding exception-handling routine.

For a complete list of predefined exceptions, see *PL/SQL User's Guide and Reference*.

Note: PL/SQL declares predefined exceptions in the STANDARD package.

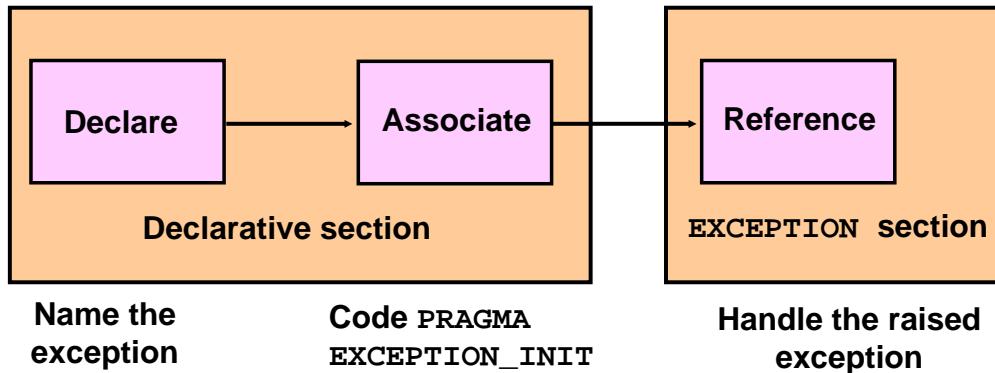

Predefined Exceptions

Exception Name	Oracle Server Error Number	Description
ACCESS_INTO_NULL	ORA-06530	Attempted to assign values to the attributes of an uninitialized object
CASE_NOT_FOUND	ORA-06592	None of the choices in the WHEN clauses of a CASE statement is selected, and there is no ELSE clause.
COLLECTION_IS_NULL	ORA-06531	Attempted to apply collection methods other than EXISTS to an uninitialized nested table or varray
CURSOR_ALREADY_OPEN	ORA-06511	Attempted to open an already open cursor
DUP_VAL_ON_INDEX	ORA-00001	Attempted to insert a duplicate value
INVALID_CURSOR	ORA-01001	Illegal cursor operation occurred
INVALID_NUMBER	ORA-01722	Conversion of character string to number fails
LOGIN_DENIED	ORA-01017	Logging on to the Oracle server with an invalid username or password
NO_DATA_FOUND	ORA-01403	Single row SELECT returned no data
NOT_LOGGED_ON	ORA-01012	PL/SQL program issues a database call without being connected to the Oracle server
PROGRAM_ERROR	ORA-06501	PL/SQL has an internal problem
ROWTYPE_MISMATCH	ORA-06504	Host cursor variable and PL/SQL cursor variable involved in an assignment have incompatible return types

Predefined Exceptions (continued)

Exception Name	Oracle Server Error Number	Description
STORAGE_ERROR	ORA-06500	PL/SQL ran out of memory or memory is corrupted.
SUBSCRIPT_BEYOND_COUNT	ORA-06533	Referenced a nested table or varray element by using an index number larger than the number of elements in the collection
SUBSCRIPT_OUTSIDE_LIMIT	ORA-06532	Referenced a nested table or varray element by using an index number that is outside the legal range (-1 for example)
SYS_INVALID_ROWID	ORA-01410	The conversion of a character string into a universal ROWID fails because the character string does not represent a valid ROWID.
TIMEOUT_ON_RESOURCE	ORA-00051	Time-out occurred while the Oracle server was waiting for a resource.
TOO_MANY_ROWS	ORA-01422	Single-row SELECT returned more than one row.
VALUE_ERROR	ORA-06502	Arithmetic, conversion, truncation, or size-constraint error occurred.
ZERO_DIVIDE	ORA-01476	Attempted to divide by zero

Trapping Non-Predefined Oracle Server Errors

Trapping Non-Predefined Oracle Server Errors

Non-predefined exceptions are similar to predefined exceptions; however, they are not defined as PL/SQL exceptions in the Oracle server. They are standard Oracle errors. You can create exceptions with standard Oracle errors using the PRAGMA EXCEPTION_INIT function. Such exceptions are called non-predefined exceptions.

You can trap a non-predefined Oracle server error by declaring it first. The declared exception is raised implicitly. In PL/SQL, the PRAGMA EXCEPTION_INIT tells the compiler to associate an exception name with an Oracle error number. That allows you to refer to any internal exception by name and to write a specific handler for it.

Note: PRAGMA (also called pseudoinstructions) is the keyword that signifies that the statement is a compiler directive, which is not processed when the PL/SQL block is executed. Rather, it directs the PL/SQL compiler to interpret all occurrences of the exception name within the block as the associated Oracle server error number.

Non-Predefined Error

Trap Oracle server error number –01400, cannot insert NULL.

```
SET SERVEROUTPUT ON
DECLARE
    insert_excep EXCEPTION;
    PRAGMA EXCEPTION_INIT
        (insert_excep, -01400);
BEGIN
    INSERT INTO departments
        (department_id, department_name) VALUES (280, NULL);
EXCEPTION
    WHEN insert_excep THEN
        DBMS_OUTPUT.PUT_LINE('INSERT OPERATION FAILED');
        DBMS_OUTPUT.PUT_LINE(SQLERRM);
END;
/
```

ORACLE

8-15

Copyright © 2004, Oracle. All rights reserved.

Non-Predefined Error

1. Declare the name of the exception in the declarative section.

Syntax

exception EXCEPTION;

where: *exception* Is the name of the exception

2. Associate the declared exception with the standard Oracle server error number using the PRAGMA EXCEPTION_INIT function.

Syntax

PRAGMA EXCEPTION_INIT(*exception*, *error_number*);

where: *exception* Is the previously declared exception

error_number Is a standard Oracle server error number

3. Reference the declared exception within the corresponding exception-handling routine.

Example

The example in the slide tries to insert the value NULL for the department_name column of the departments table. However, the operation is not successful because department_name is a NOT NULL column. Observe the following line in the example:

DBMS_OUTPUT.PUT_LINE(SQLERRM);

The SQLERRM function is used to retrieve the error message. You will learn more about SQLERRM in the next few slides.

Functions for Trapping Exceptions

- **SQLCODE:** Returns the numeric value for the error code
- **SQLERRM:** Returns the message associated with the error number

ORACLE®

8-16

Copyright © 2004, Oracle. All rights reserved.

Functions for Trapping Exceptions

When an exception occurs, you can identify the associated error code or error message by using two functions. Based on the values of the code or the message, you can decide which subsequent actions to take.

SQLCODE returns the Oracle error number for internal exceptions. SQLERRM returns the message associated with the error number.

Function	Description
SQLCODE	Returns the numeric value for the error code (You can assign it to a NUMBER variable.)
SQLERRM	Returns character data containing the message associated with the error number

Example SQLCODE Values

SQLCODE Value	Description
0	No exception encountered
1	User-defined exception
+100	NO_DATA_FOUND exception
<i>negative number</i>	Another Oracle server error number

Functions for Trapping Exceptions

Example:

```
DECLARE
    error_code      NUMBER;
    error_message   VARCHAR2(255);
BEGIN
    ...
EXCEPTION
    ...
    WHEN OTHERS THEN
        ROLLBACK;
        error_code := SQLCODE;
        error_message := SQLERRM;
        INSERT INTO errors (e_user, e_date, error_code,
                           error_message) VALUES(USER,SYSDATE,error_code,
                           error_message);
    END;
    /

```

ORACLE

8-17

Copyright © 2004, Oracle. All rights reserved.

Functions for Trapping Exceptions (continued)

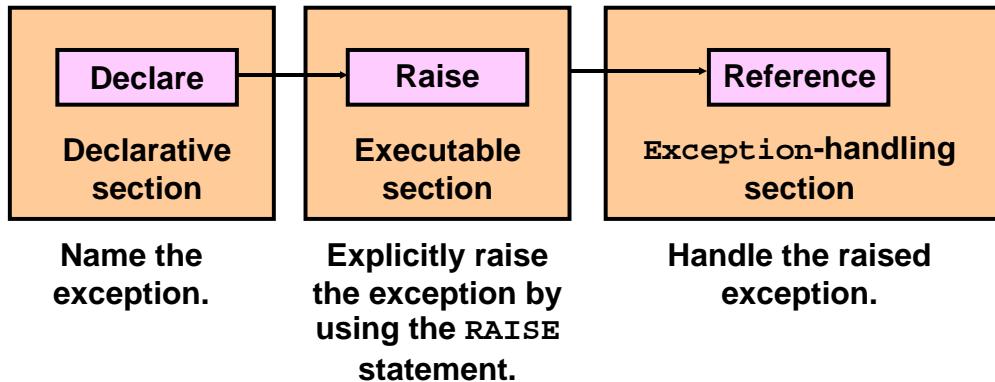

When an exception is trapped in the WHEN OTHERS exception handler, you can use a set of generic functions to identify those errors. The example in the slide illustrates the values of SQLCODE and SQLERRM being assigned to variables and then those variables being used in a SQL statement.

You cannot use SQLCODE or SQLERRM directly in a SQL statement. Instead, you must assign their values to local variables, then use the variables in the SQL statement, as shown in the following example:

```
DECLARE
    err_num NUMBER;
    err_msg VARCHAR2(100);
BEGIN
    ...
EXCEPTION
    ...
    WHEN OTHERS THEN
        err_num := SQLCODE;
        err_msg := SUBSTR(SQLERRM, 1, 100);
        INSERT INTO errors VALUES (err_num, err_msg);
    END;
    /

```

Trapping User-Defined Exceptions

Trapping User-Defined Exceptions

PL/SQL allows you to define your own exceptions. You define exceptions depending on the requirements of your application. For example, you may prompt the user to enter a department number.

Define an exception to deal with error conditions in the input data. Check whether the department number exists. If it does not, then you may have to raise the user-defined exception. PL/SQL exceptions must be:

- Declared in the declarative section of a PL/SQL block
- Raised explicitly with **RAISE** statements
- Handled in the **EXCEPTION** section

Trapping User-Defined Exceptions

```
...
ACCEPT deptno PROMPT 'Please enter the department number:'
ACCEPT name    PROMPT 'Please enter the department name:'
DECLARE
    invalid_department EXCEPTION; ← 1
    name VARCHAR2(20):='&name';
    deptno NUMBER :=&deptno;
BEGIN
    UPDATE departments
    SET department_name = name
    WHERE department_id = deptno;
    IF SQL%NOTFOUND THEN
        RAISE invalid_department; ← 2
    END IF;
    COMMIT;
EXCEPTION
    WHEN invalid_department THEN
        DBMS_OUTPUT.PUT_LINE('No such department id.');
END;
/
```

1

2

3

ORACLE®

8-19

Copyright © 2004, Oracle. All rights reserved.

Trapping User-Defined Exceptions (continued)

You trap a user-defined exception by declaring it and raising it explicitly.

1. Declare the name of the user-defined exception within the declarative section.

Syntax:

```
exception EXCEPTION;
```

where: *exception* Is the name of the exception

2. Use the RAISE statement to raise the exception explicitly within the executable section.

Syntax:

```
RAISE exception;
```

where: *exception* Is the previously declared exception

3. Reference the declared exception within the corresponding exception-handling routine.

Example

This block updates the department_name of a department. The user supplies the department number and the new name. If the user enters a department number that does not exist, no rows will be updated in the departments table. Raise an exception and print a message for the user that an invalid department number was entered.

Note: Use the RAISE statement by itself within an exception handler to re-raise the same exception and propagate it back to the calling environment.

Calling Environments

iSQL*Plus	Displays error number and message to screen
Procedure Builder	Displays error number and message to screen
Oracle Developer Forms	Accesses error number and message in an <code>ON-ERROR</code> trigger by means of the <code>ERROR_CODE</code> and <code>ERROR_TEXT</code> packaged functions
Precompiler application	Accesses exception number through the <code>SQLCA</code> data structure
An enclosing PL/SQL block	Traps exception in exception-handling routine of enclosing block

ORACLE®

8-20

Copyright © 2004, Oracle. All rights reserved.

Calling Environments

Instead of trapping an exception within the PL/SQL block, propagate the exception to allow the calling environment to handle it. Each calling environment has its own way of displaying and accessing errors.

Propagating Exceptions in a Subblock

Subblocks can handle an exception or pass the exception to the enclosing block.

```
DECLARE
    . . .
    no_rows      exception;
    integrity    exception;
    PRAGMA EXCEPTION_INIT (integrity, -2292);
BEGIN
    FOR c_record IN emp_cursor LOOP
        BEGIN
            SELECT . . .
            UPDATE . . .
            IF SQL%NOTFOUND THEN
                RAISE no_rows;
            END IF;
        END;
    END LOOP;
EXCEPTION
    WHEN integrity THEN . . .
    WHEN no_rows THEN . . .
END;
/
```

Propagating Exceptions in a Subblock

When a subblock handles an exception, it terminates normally, and control resumes in the enclosing block immediately after the subblock's END statement.

However, if a PL/SQL raises an exception and the current block does not have a handler for that exception, the exception propagates to successive enclosing blocks until it finds a handler. If none of these blocks handle the exception, an unhandled exception in the host environment results.

When the exception propagates to an enclosing block, the remaining executable actions in that block are bypassed.

One advantage of this behavior is that you can enclose statements that require their own exclusive error handling in their own block, while leaving more general exception handling to the enclosing block.

Observe in the example that the exceptions, no_rows and integrity, are declared in the outer block. In the inner block, when the no_rows exception is raised, PL/SQL looks for the exception to be handled in the subblock. Because the exception is not handled in the subblock, the exception propagates to the outer block, where PL/SQL finds the handler.

The RAISE_APPLICATION_ERROR Procedure

Syntax:

```
raise_application_error (error_number,  
                      message[, {TRUE | FALSE}]);
```

- You can use this procedure to issue user-defined error messages from stored subprograms.
- You can report errors to your application and avoid returning unhandled exceptions.

ORACLE®

8-22

Copyright © 2004, Oracle. All rights reserved.

The RAISE_APPLICATION_ERROR Procedure

Use the RAISE_APPLICATION_ERROR procedure to communicate a predefined exception interactively by returning a nonstandard error code and error message. With RAISE_APPLICATION_ERROR, you can report errors to your application and avoid returning unhandled exceptions.

In the syntax:

<i>error_number</i>	Is a user-specified number for the exception between –20000 and –20999
<i>message</i>	Is the user-specified message for the exception. It is a character string up to 2,048 bytes long.
TRUE FALSE	Is an optional Boolean parameter (If TRUE, the error is placed on the stack of previous errors. If FALSE, the default, the error replaces all previous errors.)

The RAISE_APPLICATION_ERROR Procedure

- Used in two different places:
 - Executable section
 - Exception section
- Returns error conditions to the user in a manner consistent with other Oracle server errors.

ORACLE®

8-23

Copyright © 2004, Oracle. All rights reserved.

The RAISE_APPLICATION_ERROR Procedure (continued)

The RAISE_APPLICATION_ERROR can be used in either (or both) the executable section and the exception section of a PL/SQL program. The returned error is consistent with how the Oracle server produces a predefined, non-predefined, or user-defined error. The error number and message is displayed to the user.

RAISE_APPLICATION_ERROR

Executable section:

```
BEGIN  
...  
    DELETE FROM employees  
        WHERE manager_id = v_mgr;  
    IF SQL%NOTFOUND THEN  
        RAISE_APPLICATION_ERROR(-20202,  
            'This is not a valid manager');  
    END IF;  
    ...
```

Exception section:

```
...  
EXCEPTION  
    WHEN NO_DATA_FOUND THEN  
        RAISE_APPLICATION_ERROR (-20201,  
            'Manager is not a valid employee.');
```

ORACLE

RAISE_APPLICATION_ERROR

The slide shows that the RAISE_APPLICATION_ERROR procedure can be used in both the executable and the exception sections of a PL/SQL program.

Here is another example of using the RAISE_APPLICATION_ERROR procedure:

```
DECLARE  
    e_name EXCEPTION;  
    PRAGMA EXCEPTION_INIT (e_name, -20999);  
BEGIN  
    ...  
    DELETE FROM employees  
        WHERE last_name = 'Higgins';  
    IF SQL%NOTFOUND THEN  
        RAISE_APPLICATION_ERROR(-20999, 'This is not a  
            valid last name');  
    END IF;  
EXCEPTION  
    WHEN e_name THEN  
        -- handle the error  
    ...  
END;  
/
```

Summary

In this lesson, you should have learned how to:

- **Define PL/SQL exceptions**
- **Add an EXCEPTION section to the PL/SQL block to deal with exceptions at run time**
- **Handle different types of exceptions:**
 - **Predefined exceptions**
 - **Non-predefined exceptions**
 - **User-defined exceptions**
- **Propagate exceptions in nested blocks and call applications**

Summary

In PL/SQL, a warning or error condition at run time is called an exception. Predefined exceptions are error conditions that are defined by the Oracle server. Non-predefined exceptions can be any standard Oracle server errors. User-defined exceptions are exceptions specific to your application. The PRAGMA EXCEPTION_INIT function can be used to associate a declared exception name with an Oracle server error.

You can define exceptions of your own in the declarative part of any PL/SQL block. For example, you can define an exception named INSUFFICIENT_FUNDS to flag overdrawn bank accounts.

When an error occurs, an exception is raised. Normal execution stops and control transfers to the exception-handling section of your PL/SQL block. Internal exceptions are raised implicitly (automatically) by the run-time system; however, user-defined exceptions must be raised explicitly. To handle raised exceptions, you write separate routines called exception handlers. In this lesson, you have learned how to deal with different types of exceptions.

Practice 8: Overview

This practice covers the following topics:

- **Handling named exceptions**
- **Creating and invoking user-defined exceptions**

Practice 8: Overview

In this practice, you create exception handlers for specific situations.

Practice 8

1. The purpose of this example is to show the usage of predefined exceptions. Write a PL/SQL block to select the name of the employee with a given salary value.
 - a. Delete all records in the messages table. Use the DEFINE command to define a variable `sal` and initialize it to 6000.
 - b. In the declarative section declare two variables: `ename` of type `employees.last_name` and `emp_sal` of type `employees.salary`. Pass the value of the substitution variables to `emp_sal`.
 - c. In the executable section retrieve the last names of employees whose salaries are equal to the value in `emp_sal`.

Note: Do not use explicit cursors.
If the salary entered returns only one row, insert into the `messages` table the employee's name and the salary amount.
 - d. If the salary entered does not return any rows, handle the exception with an appropriate exception handler and insert into the `messages` table the message "No employee with a salary of <salary>."
 - e. If the salary entered returns more than one row, handle the exception with an appropriate exception handler and insert into the `messages` table the message "More than one employee with a salary of <salary>."
 - f. Handle any other exception with an appropriate exception handler and insert into the `messages` table the message "Some other error occurred."
 - g. Display the rows from the `messages` table to check whether the PL/SQL block has executed successfully. Sample output is shown below.

RESULTS

More than one employee with a salary of 6000

2. The purpose of this example is to show how to declare exceptions with a standard Oracle server error. Use the Oracle server error ORA-02292 (integrity constraint violated – child record found).
 - a. In the declarative section declare an exception `childrecord_exists`. Associate the declared exception with the standard Oracle server error -02292.
 - b. In the executable section display 'Deleting department 40.....'. Include a `DELETE` statement to delete the department with `department_id` 40.

Practice 8 (continued)

- c. Include an exception section to handle the `childrecord_exists` exception and display the appropriate message. Sample output is shown below.

Deleting department 40.....

Cannot delete this department. There are employees in this department
(child records exist.)

PL/SQL procedure successfully completed.

3. Load the script `lab_07_04_soln.sql`.

- a. Observe the declarative section of the outer block. Note that the `no_such_employee` exception is declared.
- b. Look for the comment “RAISE EXCEPTION HERE.” If the value of `emp_id` is not between 100 and 206, then raise the `no_such_employee` exception.
- c. Look for the comment “INCLUDE EXCEPTION SECTION FOR OUTER BLOCK” and handle the exceptions `no_such_employee` and `too_many_rows`. Display appropriate messages when the exceptions occur. The employees table has only one employee working in the HR department and therefore the code is written accordingly. The `too_many_rows` exception is handled to indicate that the select statement retrieves more than one employee working in the HR department.
- d. Close the outer block.
- e. Save your script as `lab_08_03_soln.sql`.
- f. Execute the script. Enter the employee number and the department number and observe the output. Enter different values and check for different conditions.

The sample output for employee ID 203 and department ID 100 is shown below.

NUMBER OF RECORDS MODIFIED : 6

The following employees' salaries are updated

Creating Stored Procedures and Functions

9

ORACLE®

Copyright © 2004, Oracle. All rights reserved.

Objectives

After completing this lesson, you should be able to do the following:

- **Differentiate between anonymous blocks and subprograms**
- **Create a simple procedure and invoke it from an anonymous block**
- **Create a simple function**
- **Create a simple function that accepts a parameter**
- **Differentiate between procedures and functions**

ORACLE®

9-2

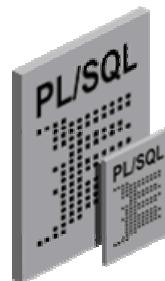

Copyright © 2004, Oracle. All rights reserved.

Lesson Aim

You have learned about anonymous blocks. This lesson introduces you to named blocks, also called subprograms. Procedures and functions are called PL/SQL subprograms. You will be able to differentiate between anonymous blocks and subprograms.

Procedures and Functions

- Are named PL/SQL blocks
- Are called PL/SQL subprograms
- Have block structures similar to anonymous blocks:
 - Optional declarative section (without `DECLARE` keyword)
 - Mandatory executable section
 - Optional section to handle exceptions

ORACLE®

9-3

Copyright © 2004, Oracle. All rights reserved.

Procedures and Functions

The only PL/SQL code that has been introduced in this course so far is anonymous blocks. As the name indicates, anonymous blocks are unnamed executable PL/SQL blocks. Because they are unnamed, they can neither be reused nor stored for later use.

Procedures and functions are named PL/SQL blocks. They are also known as subprograms. These subprograms are compiled and stored in the database. The block structure of the subprograms is similar to the structure of anonymous blocks. Subprograms can be declared not only at the schema level but also within any other PL/SQL block. A subprogram contains the following sections:

Declarative section: Subprograms can have an optional declarative section. However, unlike anonymous blocks, the declarative section of the subprograms does not start with the keyword `DECLARE`. The optional declarative section follows the keyword `IS` or `AS` in the subprogram declaration.

Executable section: This is the mandatory section of the subprogram, which contains the implementation of the business logic. Looking at the code in this section, you can easily determine the purpose of writing this subprogram. The business functionality is coded in this section. This section begins and ends with the keyword `BEGIN` and `END`, respectively.

Exception section: This is an optional section that is included to handle exceptions.

Differences Between Anonymous Blocks and Subprograms

Anonymous Blocks	Subprograms
Unnamed PL/SQL blocks	Named PL/SQL blocks
Compiled every time	Compiled only once
Not stored in the database	Stored in the database
Cannot be invoked by other applications	They are named and therefore can be invoked by other applications
Do not return values	Subprograms called functions must return values
Cannot take parameters	Can take parameters

ORACLE®

9-4

Copyright © 2004, Oracle. All rights reserved.

Differences Between Anonymous Blocks and Subprograms

The table in the slide not only shows the differences between anonymous blocks and subprograms, but also highlights the benefits of subprograms to a great extent.

Anonymous blocks are not persistent database objects. They are compiled and executed only once. They are not stored in the database for reuse. If you want to reuse, you must rerun the script that creates the anonymous block which causes recompilation and execution.

Procedures and functions are compiled and stored in the database in a compiled form. They are recompiled only when they are modified. Because they are stored in the database, any application can make use of these subprograms based on appropriate permissions. The calling application can pass parameters to the procedures if the procedure is designed to accept parameters. Similarly, a calling application can retrieve a value if it is invoking a function or a procedure.

Procedure: Syntax

```
CREATE [OR REPLACE] PROCEDURE procedure_name
[(argument1 [mode1] datatype1,
  argument2 [mode2] datatype2,
  . . .)]
IS | AS
procedure_body;
```

Procedure: Syntax

The slide shows the syntax for creating procedures. In the syntax:

- | | |
|-----------------------|---|
| <i>procedure_name</i> | Is the name of the procedure to be created |
| <i>argument</i> | Is the name given to the procedure parameter. Every argument is associated with a mode and datatype. You can have any number of arguments separated by a comma. |
| <i>mode</i> | Mode of argument:
IN (default)
OUT
IN OUT |
| <i>datatype</i> | Is the data type of the associated parameter. The datatype of parameters can not have explicit size, instead use %TYPE. |
| <i>Procedure_body</i> | Is the PL/SQL block that makes up the code |

The argument list is optional in a procedure declaration. You will learn about procedures in detail in the course *Oracle Database 10g: Develop PL/SQL Program Units*.

Procedure: Example

```
...
CREATE TABLE dept AS SELECT * FROM departments;
CREATE PROCEDURE add_dept IS
    dept_id dept.department_id%TYPE;
    dept_name dept.department_name%TYPE;
BEGIN
    dept_id:=280;
    dept_name:='ST-Curriculum';
    INSERT INTO dept(department_id,department_name)
VALUES(dept_id,dept_name);
    DBMS_OUTPUT.PUT_LINE(' Inserted ' ||
    SQL%ROWCOUNT || ' row ');
END;
/
```

ORACLE®

9-6

Copyright © 2004, Oracle. All rights reserved.

Procedure: Example

Observe the code in the slide. The add_dept procedure inserts a new department with the department_id 280 and department_name ST-Curriculum. The procedure declares two variables, dept_id and dept_name, in the declarative section. The declarative section of a procedure starts immediately after the procedure declaration and does not begin with the keyword DECLARE. The procedure uses the implicit cursor attribute or the SQL%ROWCOUNT SQL attribute to check if the row was successfully inserted. SQL%ROWCOUNT should return 1 in this case.

Note: When you create any object such as table, procedure, function, and so on, the entries are made to the user_objects table. When the code in the slide is executed successfully, you can check the user_objects table by issuing the following command:

```
SELECT object_name,object_type FROM user_objects;
```

ADD_DEPT	PROCEDURE
DEPT	TABLE

Procedure: Example (continued)

The source of the procedure is stored in the `user_source` table. You can check the source for the procedure by issuing the following command:

```
SELECT * FROM user_source WHERE name='ADD_DEPT' ;
```

NAME	TYPE	LINE	TEXT
ADD_DEPT	PROCEDURE	1	PROCEDURE add_dept IS
ADD_DEPT	PROCEDURE	2	dept_id dept.department_id%TYPE;
ADD_DEPT	PROCEDURE	3	dept_name dept.department_name%TYPE;
ADD_DEPT	PROCEDURE	4	BEGIN
ADD_DEPT	PROCEDURE	5	dept_id:=280;
ADD_DEPT	PROCEDURE	6	dept_name:='ST-Curriculum';
ADD_DEPT	PROCEDURE	7	INSERT INTO dept(department_id,department_name)
ADD_DEPT	PROCEDURE	8	VALUES(dept_id,dept_name);
ADD_DEPT	PROCEDURE	9	DBMS_OUTPUT.PUT_LINE(' Inserted ' SQL%ROWCOUNT ' row ');
ADD_DEPT	PROCEDURE	10	END;
ADD_DEPT	PROCEDURE	11	

Invoking the Procedure

```
BEGIN
    add_dept;
END;
/
SELECT department_id, department_name FROM
dept WHERE department_id=280;
```

Inserted 1 row
PL/SQL procedure successfully completed.

DEPARTMENT_ID	DEPARTMENT_NAME
280	ST-Curriculum

ORACLE®

Invoking the Procedure

The slide shows how to invoke a procedure from an anonymous block. You have to include the call to the procedure in the executable section of the anonymous block. Similarly, you can invoke the procedure from any application such as a forms application, Java application and so on. The select statement in the code checks to see if the row was successfully inserted.

You can also invoke a procedure with the SQL statement `CALL <procedure_name>`.

Function: Syntax

```
CREATE [OR REPLACE] FUNCTION function_name
[(argument1 [mode1] datatype1,
  argument2 [mode2] datatype2,
  . . .)]
RETURN datatype
IS|AS
function_body;
```

Function: Syntax

The slide shows the syntax for creating a function. In the syntax:

<i>function_name</i>	Is the name of the function to be created
<i>argument</i>	Is the name given to the function parameter. Every argument is associated with a mode and datatype. You can have any number or arguments separated by a comma. You will pass the argument when you invoke the function
<i>mode</i>	The type of the parameter; only IN parameters should be declared
<i>datatype</i>	Is the data type of the associated parameter
RETURN <i>datatype</i>	Is the data type of the value returned by the function
<i>function_body</i>	Is the PL/SQL block that makes up the function code

The argument list is optional in function declaration. The difference between a procedure and a function is that a function must return a value to the calling program. Therefore, the syntax contains *return_type* which specifies the data type of the value that the function returns. A procedure may return a value via an OUT or IN OUT parameter.

Function: Example

```
CREATE FUNCTION check_sal RETURN Boolean IS
    dept_id employees.department_id%TYPE;
    empno   employees.employee_id%TYPE;
    sal      employees.salary%TYPE;
    avg_sal employees.salary%TYPE;
BEGIN
    empno:=205;
    SELECT salary,department_id INTO sal,dept_id
    FROM employees WHERE employee_id= empno;
    SELECT avg(salary) INTO avg_sal FROM employees
    WHERE department_id=dept_id;
    IF sal > avg_sal THEN
        RETURN TRUE;
    ELSE
        RETURN FALSE;
    END IF;
EXCEPTION
    WHEN NO_DATA_FOUND THEN
        RETURN NULL;
END;
/
```

ORACLE

9-10

Copyright © 2004, Oracle. All rights reserved.

Function: Example

The function `check_sal` is written to check if the salary of a particular employee is greater or less than the average salary of all employees working in his department. The function returns TRUE if the salary of the employee is greater than the average salary of employees in his department else returns FALSE. The function returns NULL if a `NO_DATA_FOUND` exception is thrown. Observe that the function checks for the employee with the employee ID 205. The function is hard coded to check for this employee ID only. If you want to check for any other employees, you will have to modify the function itself. You can solve this problem by declaring the function such that it accepts an argument. You can then pass the employee ID as parameter.

Invoking the Function

```
SET SERVEROUTPUT ON
BEGIN
  IF (check_sal IS NULL) THEN
    DBMS_OUTPUT.PUT_LINE('The function returned
      NULL due to exception');
  ELSIF (check_sal) THEN
    DBMS_OUTPUT.PUT_LINE('Salary > average');
  ELSE
    DBMS_OUTPUT.PUT_LINE('Salary < average');
  END IF;
END;
/
```

Salary > average
PL/SQL procedure successfully completed.

ORACLE®

9-11

Copyright © 2004, Oracle. All rights reserved.

Invoking the Function

You include the call to the function in the executable section of the anonymous block. The function is invoked as a part of a statement. Remember that the function `check_sal` returns Boolean or NULL and therefore the call to the function is included as the conditional expression for the `IF` block.

Note: You can use the `DESCRIBE` command to check the arguments and return type of the function. Example:

```
DESCRIBE check_sal;
```

Passing Parameter to the Function

```
DROP FUNCTION check_sal;
/
CREATE FUNCTION check_sal(empno employees.employee_id%TYPE)
RETURN Boolean IS
    dept_id employees.department_id%TYPE;
    sal     employees.salary%TYPE;
    avg_sal employees.salary%TYPE;
BEGIN
    SELECT salary,department_id INTO sal,dept_id
    FROM employees WHERE employee_id=empno;
    SELECT avg(salary) INTO avg_sal FROM employees
    WHERE department_id=dept_id;
    IF sal > avg_sal THEN
        RETURN TRUE;
    ELSE
        RETURN FALSE;
    END IF;
EXCEPTION ...
...
```

ORACLE

9-12

Copyright © 2004, Oracle. All rights reserved.

Passing Parameter to the Function

Remember that the function was hard coded to check the salary of employee with the employee ID 205. The code shown in the slide removes that constraint because it is re-written to accept employee number as parameter. You can now pass different employee numbers and check for the employee's salary.

You will learn more about functions in the course *Oracle Database 10g: Develop PL/SQL Program Units*.

Invoking the Function with a Parameter

```
BEGIN
DBMS_OUTPUT.PUT_LINE('Checking for employee with id 205');
IF (check_sal(205) IS NULL) THEN
DBMS_OUTPUT.PUT_LINE('The function returned
NULL due to exception');
ELSIF (check_sal(205)) THEN
DBMS_OUTPUT.PUT_LINE('Salary > average');
ELSE
DBMS_OUTPUT.PUT_LINE('Salary < average');
END IF;
DBMS_OUTPUT.PUT_LINE('Checking for employee with id 70');
IF (check_sal(70) IS NULL) THEN
DBMS_OUTPUT.PUT_LINE('The function returned
NULL due to exception');
ELSIF (check_sal(70)) THEN
...
END IF;
END;
/
```

ORACLE

9-13

Copyright © 2004, Oracle. All rights reserved.

Invoking the Function with a Parameter

The code in the slide invokes the function twice by passing parameters. The output of the code is shown below.

Checking for employee with id 205
Salary > average
Checking for employee with id 70
The function returned NULL due to exception
PL/SQL procedure successfully completed.

Summary

In this lesson, you should have learned how to:

- **Create a simple procedure**
- **Invoke the procedure from an anonymous block**
- **Create a simple function**
- **Create a simple function that accepts parameters**
- **Invoke the function from an anonymous block**

ORACLE®

9-14

Summary

You can use anonymous blocks to design any functionality in PL/SQL. However, the main constraint with anonymous blocks is that they are not stored and therefore cannot be reused. Instead of creating anonymous blocks you can create PL/SQL subprograms. Procedures and functions are called subprograms. These are named PL/SQL blocks. Subprograms express reusable logic by virtue of parameterization. The structure of a procedure or a function is similar to the structure of anonymous block. These subprograms are stored in the database and are therefore reusable.

Practice 9: Overview

This practice covers the following topics:

- Converting an existing anonymous block to a procedure
- Modifying the procedure to accept a parameter
- Writing an anonymous block to invoke the procedure

Practice 9: Overview

This practice helps you revisit some of the topics you have learned in this lesson. You will convert an existing anonymous block to a procedure and modify it to accept parameters. You will write an anonymous block to invoke the procedure.

Practice 9

1. In *iSQL*Plus*, load the script `lab_02_04_soln.sql` that you created for question 4 of practice 2.
 - a. Modify the script to convert the anonymous block to a procedure called `greet`.
 - b. Execute the script to create the procedure.
 - c. Save your script as `lab_09_01_soln.sql`.
 - d. Click the Clear button to clear the workspace.
 - e. Create and execute an anonymous block to invoke the procedure `greet`. Sample output is shown below.

```
Hello World  
TODAY IS : 20-JAN-04  
TOMORROW IS : 21-JAN-04  
PL/SQL procedure successfully completed.
```

2. Load the script `lab_09_01_soln.sql`.
 - a. Drop the procedure `greet` by issuing the following command:
`DROP PROCEDURE greet`
 - b. Modify the procedure to accept an argument of type `VARCHAR2`. Call the argument `name`.
 - c. Print `Hello <name>` instead of printing `Hello World`.
 - d. Save your script as `lab_09_02_soln.sql`.
 - e. Execute the script to create the procedure.
 - f. Create and execute an anonymous block to invoke the procedure `greet` with a parameter. Sample output is shown below.

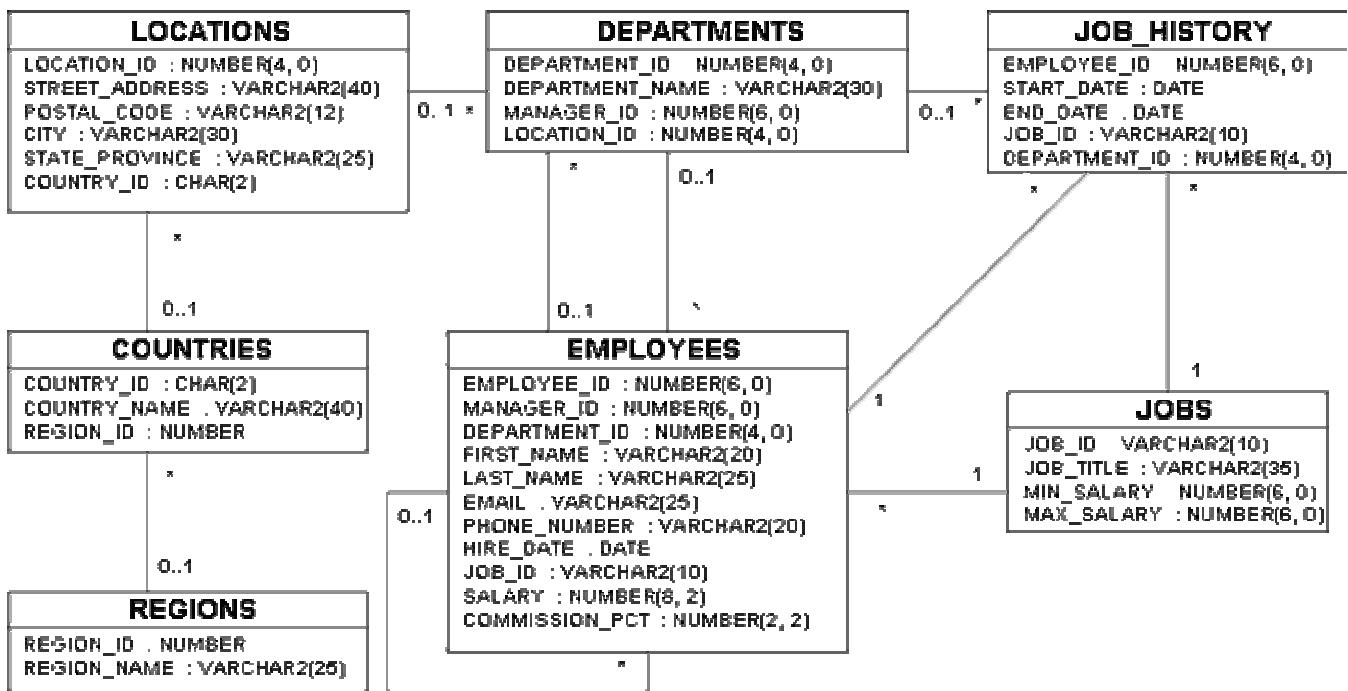

```
Hello Neema  
TODAY IS : 20-JAN-04  
TOMORROW IS : 21-JAN-04  
PL/SQL procedure successfully completed.
```

Cursor Variables

Cursor variables are like C or Pascal pointers, which hold the memory location (address) of some item instead of the item itself. Thus, declaring a cursor variable creates a pointer, not an item. In PL/SQL, a pointer has the data type REF X, where REF is short for REFERENCE and X stands for a class of objects. A cursor variable has the REF CURSOR data type.

Like a cursor, a cursor variable points to the current row in the result set of a multirow query. However, cursors differ from cursor variables the way constants differ from variables. A cursor is static, but a cursor variable is dynamic because it is not tied to a specific query. You can open a cursor variable for any type-compatible query. This gives you more flexibility.

Cursor variables are available to every PL/SQL client. For example, you can declare a cursor variable in a PL/SQL host environment such as an OCI or Pro*C program, and then pass it as an input host variable (bind variable) to PL/SQL. Moreover, application development tools such as Oracle Forms and Oracle Reports, which have a PL/SQL engine, can use cursor variables entirely on the client side. The Oracle server also has a PL/SQL engine. You can pass cursor variables back and forth between an application and server through remote procedure calls (RPCs).

Why Use Cursor Variables?

- You can use cursor variables to pass query result sets between PL/SQL stored subprograms and various clients.
- PL/SQL can share a pointer to the query work area in which the result set is stored.
- You can pass the value of a cursor variable freely from one scope to another.
- You can reduce network traffic by having a PL/SQL block open (or close) several host cursor variables in a single round trip.

Why Use Cursor Variables?

You use cursor variables to pass query result sets between PL/SQL stored subprograms and various clients. Neither PL/SQL nor any of its clients owns a result set; they simply share a pointer to the query work area in which the result set is stored. For example, an OCI client, an Oracle Forms application, and the Oracle server can all refer to the same work area.

A query work area remains accessible as long as any cursor variable points to it. Therefore, you can pass the value of a cursor variable freely from one scope to another. For example, if you pass a host cursor variable to a PL/SQL block that is embedded in a Pro*C program, the work area to which the cursor variable points remains accessible after the block completes.

If you have a PL/SQL engine on the client side, calls from client to server impose no restrictions. For example, you can declare a cursor variable on the client side, open and fetch from it on the server side, then continue to fetch from it back on the client side. Also, you can reduce network traffic by having a PL/SQL block open (or close) several host cursor variables in a single round trip.

A cursor variable holds a reference to the cursor work area in the PGA instead of addressing it with a static name. Because you address this area by a reference, you gain the flexibility of a variable.

Defining REF CURSOR Types

- Define a REF CURSOR type.

```
Define a REF CURSOR type
TYPE ref_type_name IS REF CURSOR [RETURN
return_type];
```

- Declare a cursor variable of that type.

```
ref_cv ref_type_name;
```

- Example:

```
DECLARE
  TYPE DeptCurTyp IS REF CURSOR RETURN
    departments%ROWTYPE;
  dept_cv DeptCurTyp;
```

ORACLE®

C-4

Defining REF CURSOR Types

To define a REF CURSOR, you perform two steps. First, you define a REF CURSOR type, and then you declare cursor variables of that type. You can define REF CURSOR types in any PL/SQL block, subprogram, or package using the following syntax:

```
TYPE ref_type_name IS REF CURSOR [RETURN return_type];
```

in which:

ref_type_name Is a type specifier used in subsequent declarations of cursor variables

return_type Represents a record or a row in a database table

In the above example, you specify a return type that represents a row in the database table DEPARTMENT.

REF CURSOR types can be strong (restrictive) or weak (nonrestrictive). As the next example shows, a strong REF CURSOR type definition specifies a return type, but a weak definition does not:

```
DECLARE
```

```
  TYPE EmpCurTyp IS REF CURSOR RETURN employees%ROWTYPE; --  
strong
```

```
  TYPE GenericCurTyp IS REF CURSOR; -- weak
```

Defining REF CURSOR Types (continued)

Strong REF CURSOR types are less error prone because the PL/SQL compiler lets you associate a strongly typed cursor variable only with type-compatible queries. However, weak REF CURSOR types are more flexible because the compiler lets you associate a weakly typed cursor variable with any query.

Declaring Cursor Variables

After you define a REF CURSOR type, you can declare cursor variables of that type in any PL/SQL block or subprogram. In the following example, you declare the cursor variable DEPT_CV:

```
DECLARE
```

```
    TYPE DeptCurTyp IS REF CURSOR RETURN departments%ROWTYPE;
    dept_cv DeptCurTyp; -- declare cursor variable
```

Note: You cannot declare cursor variables in a package. Unlike packaged variables, cursor variables do not have persistent states. Remember, declaring a cursor variable creates a pointer, not an item. Cursor variables cannot be saved in the database; they follow the usual scoping and instantiation rules.

In the RETURN clause of a REF CURSOR type definition, you can use %ROWTYPE to specify a record type that represents a row returned by a strongly (not weakly) typed cursor variable, as follows:

```
DECLARE
```

```
    TYPE TmpCurTyp IS REF CURSOR RETURN employees%ROWTYPE;
    tmp_cv TmpCurTyp; -- declare cursor variable
    TYPE EmpCurTyp IS REF CURSOR RETURN tmp_cv%ROWTYPE;
    emp_cv EmpCurTyp; -- declare cursor variable
```

Likewise, you can use %TYPE to provide the data type of a record variable, as the following example shows:

```
DECLARE
```

```
    dept_rec departments%ROWTYPE; -- declare record variable
    TYPE DeptCurTyp IS REF CURSOR RETURN dept_rec%TYPE;
    dept_cv DeptCurTyp; -- declare cursor variable
```

In the final example, you specify a user-defined RECORD type in the RETURN clause:

```
DECLARE
```

```
    TYPE EmpRecTyp IS RECORD (
        empno NUMBER(4),
        ename VARCHAR2(10),
        sal    NUMBER(7,2));
    TYPE EmpCurTyp IS REF CURSOR RETURN EmpRecTyp;
    emp_cv EmpCurTyp; -- declare cursor variable
```

Cursor Variables As Parameters

You can declare cursor variables as the formal parameters of functions and procedures. In the following example, you define the REF CURSOR type EmpCurTyp, and then declare a cursor variable of that type as the formal parameter of a procedure:

```
DECLARE  
  TYPE EmpCurTyp IS REF CURSOR RETURN emp%ROWTYPE;  
  PROCEDURE open_emp_cv (emp_cv IN OUT EmpCurTyp) IS ...
```

Using the OPEN-FOR, FETCH, and CLOSE Statements

- The **OPEN-FOR statement associates a cursor variable with a multirow query, executes the query, identifies the result set, and positions the cursor to point to the first row of the result set.**
- The **FETCH statement returns a row from the result set of a multirow query, assigns the values of select-list items to corresponding variables or fields in the INTO clause, increments the count kept by %ROWCOUNT, and advances the cursor to the next row.**
- The **CLOSE statement disables a cursor variable.**

Using the OPEN-FOR, FETCH, and CLOSE Statements

You use three statements to process a dynamic multirow query: OPEN-FOR, FETCH, and CLOSE. First, you “open” a cursor variable “for” a multirow query. Then, you “fetch” rows from the result set one at a time. When all the rows are processed, you “close” the cursor variable.

Opening the Cursor Variable

The OPEN-FOR statement associates a cursor variable with a multirow query, executes the query, identifies the result set, positions the cursor to point to the first row of the results set, then sets the rows-processed count kept by %ROWCOUNT to zero. Unlike the static form of OPEN-FOR, the dynamic form has an optional USING clause. At run time, bind arguments in the USING clause replace corresponding placeholders in the dynamic SELECT statement. The syntax is:

```
OPEN {cursor_variable | :host_cursor_variable} FOR  
dynamic_string  
[USING bind_argument[, bind_argument]...];
```

where CURSOR_VARIABLE is a weakly typed cursor variable (one without a return type), HOST_CURSOR_VARIABLE is a cursor variable declared in a PL/SQL host environment such as an OCI program, and dynamic_string is a string expression that represents a multirow query.

Using the OPEN-FOR, FETCH, and CLOSE Statements (continued)

In the following example, the syntax declares a cursor variable, and then associates it with a dynamic SELECT statement that returns rows from the employees table:

```
DECLARE
  TYPE EmpCurTyp IS REF CURSOR; -- define weak REF CURSOR
  type
  emp_cv  EmpCurTyp; -- declare cursor variable
  my_ename VARCHAR2(15);
  my_sal   NUMBER := 1000;
BEGIN
  OPEN emp_cv FOR -- open cursor variable
    'SELECT last_name, salary FROM employees WHERE salary >
     :s'
    USING my_sal;
  ...
END;
```

Any bind arguments in the query are evaluated only when the cursor variable is opened. Thus, to fetch rows from the cursor using different bind values, you must reopen the cursor variable with the bind arguments set to their new values.

Fetching from the Cursor Variable

The FETCH statement returns a row from the result set of a multirow query, assigns the values of select-list items to corresponding variables or fields in the INTO clause, increments the count kept by %ROWCOUNT, and advances the cursor to the next row. Use the following syntax:

```
FETCH {cursor_variable | :host_cursor_variable}
  INTO {define_variable[, define_variable]... | record};
```

Continuing the example, fetch rows from cursor variable EMP_CV into define variables MY_ENAME and MY_SAL:

```
LOOP
  FETCH emp_cv INTO my_ename, my_sal; -- fetch next row
  EXIT WHEN emp_cv%NOTFOUND; -- exit loop when last row is
  fetched
  -- process row
END LOOP;
```

For each column value returned by the query associated with the cursor variable, there must be a corresponding, type-compatible variable or field in the INTO clause. You can use a different INTO clause on separate fetches with the same cursor variable. Each fetch retrieves another row from the same result set. If you try to fetch from a closed or never-opened cursor variable, PL/SQL raises the predefined exception INVALID_CURSOR.

Using the OPEN-FOR, FETCH, and CLOSE Statements (continued)

Closing the Cursor Variable

The CLOSE statement disables a cursor variable. After that, the associated result set is undefined. Use the following syntax:

```
CLOSE {cursor_variable | :host_cursor_variable};
```

In this example, when the last row is processed, close the EMP_CV cursor variable:

```
LOOP
  FETCH emp_cv INTO my_ename, my_sal;
  EXIT WHEN emp_cv%NOTFOUND;
  -- process row
END LOOP;
CLOSE emp_cv; -- close cursor variable
```

If you try to close an already-closed or never-opened cursor variable, PL/SQL raises INVALID_CURSOR.

An Example of Fetching

```
DECLARE
    TYPE EmpCurTyp IS REF CURSOR;
    emp_cv    EmpCurTyp;
    emp_rec   employees%ROWTYPE;
    sql_stmt  VARCHAR2(200);
    my_job    VARCHAR2(10) := 'ST_CLERK';
BEGIN
    sql_stmt := 'SELECT * FROM employees
                WHERE job_id = :j';
    OPEN emp_cv FOR sql_stmt USING my_job;
    LOOP
        FETCH emp_cv INTO emp_rec;
        EXIT WHEN emp_cv%NOTFOUND;
        -- process record
    END LOOP;
    CLOSE emp_cv;
END;
/
```

An Example of Fetching

The example in the slide shows that you can fetch rows from the result set of a dynamic multirow query into a record. First you must define a REF CURSOR type, EmpCurTyp. Next you define a cursor variable emp_cv, of the type EmpcurTyp. In the executable section of the PL/SQL block, the OPEN-FOR statement associates the cursor variable EMP_CV with the multirow query, sql_stmt. The FETCH statement returns a row from the result set of a multirow query and assigns the values of select-list items to EMP_REC in the INTO clause. When the last row is processed, close the cursor variable EMP_CV.
